

# Princeton Township (1110)

## Introduction

This municipal chapter is an element of the Mercer County Wastewater Management Plan prepared by the Mercer County Planning Division in accordance with N.J.A.C. 7:15.

Princeton Township is located in the north eastern portion of Mercer County and encompasses approximately 17 square miles. The Township, like most of Mercer County, is suburban with small areas of contiguous rural landscape still remaining. Princeton Township borders Princeton Borough, an established, self-governing municipality, on all sides. Both suburban and rural lands are intersected by a network of streams that make their way through to other municipalities and define the southeastern and eastern borders of the Township. The major streams on the western side of the Township are bordered by preserved open space. Approximately 3 percent of the Township's land, in the southeastern corner, is located in the agriculture development area and is eligible for farmland preservation programs. In addition, approximately 16 percent of the Township is comprised of public parks and preserved open space. These areas include municipal and regional parks, and natural and cultural areas. The remaining land within the Township consists mainly of residential housing and educational campuses. A mix of residential housing is found throughout the Township with the densest housing found adjacent to the Princeton Borough border. Route 206, located in the center of the Township, is the major north-south transportation corridor.

The 2005 DVRPC (Delaware Valley Regional Planning Commission) population projection estimates Princeton's population in 2010 to be 17,012 up from the 2005 projection of 16,976. The 2007 DVRPC population projection estimates a slight increase in Princeton's 2010 population to be 17,200.

Following are some important considerations for this municipality with respect to wastewater management planning:

- Princeton Township is considered a non-urban municipality.

In this document the following terms are used frequently:

EDUs - Equivalent Dwelling Units - a measure where one unit is equivalent to wastewater effluent from one dwelling unit. NJDEP defines a dwelling unit to mean any building or portion of a building, permanent or temporary, used or proposed to be used as a residence either seasonally or throughout the year. Most often, EDU is used in reference to a single family home.

gpd – gallons per day, a unit of flow measurement.

GSA - General Service Area (GSA) - represents the area to be served by septic systems or discharges to groundwater. For the purpose of this municipal chapter, GSAs are analogous to Individual Subsurface Sewage Disposal Systems (ISSDS).

GW – groundwater

HUC11 - Hydrologic Unit Code consisting of 11 digits – a United States Geological Survey (USGS) standard designation for subwatersheds delineated based on topography.

ISSDS – Individual Subsurface Sewage Disposal System – Also known as septic systems.

mgd – million gallons per day, a unit of flow measurement.

Nitrate Dilution Model (NDM) –The NDM is required by NJDEP and follows the calculations methodology developed by the New Jersey Geological Service (NJGS). The NDM uses the soils type (SSURGO (NRCS) digital soils GIS layer revised by DEP) to estimate the minimum lot size needed to provide enough recharge to dilute nitrate to a specified target. This method is intended to be a guide for estimating the impact of nitrate from septic tanks on groundwater quality. The NDM uses the minimum lot size to calculate the number of EDUs possible for a given area.

Non-discharge areas - areas where additional wastewater generation and/or discharge are prohibited.

Non-urban municipality- any municipality not officially designated as an urban municipality

Sewer Service Area (SSA) – represents the area to be served by a centralized treatment facility.

STP – Sewage Treatment Plant

SW – surface water

Undeveloped/under developed - areas within the existing or future sewer service area that could be developed

WMP – Wastewater Management Plan

WPCF – Water Pollution Control Facility

WPCP – Water Pollution Control Plant

WTF – Water Treatment Facility

WWTP – Wastewater Treatment Plant

## Existing Infrastructure

The existing wastewater collection and conveyance infrastructure within this municipality consists of the following:

- Collection System – The Township is largely developed while the northeast and southwest corners retain rural and natural features amongst developed lands. The collection system and associated trunk sewers convey flow from the populated areas within Princeton Township to the SBRSA River Road STP.
- Pumping Stations – Princeton Township currently has **XX** pumping stations within the municipality.

The existing major wastewater treatment facilities located within the municipality include:

- SBRSA River Road STP – the wastewater treatment facility serving the municipality.

Tables 1a and 1b include additional minor facilities in Princeton Township regulated through NJDEP that have individual New Jersey Pollutant Discharge Elimination System (NJPDDES) discharge permits. Table 1a shows facilities which are indicated as discharge to groundwater (DGW). Table 1b shows facilities which are indicated as discharge to surface water.

The reference sources for Tables 1a and 1b were facility owners, NJDEP Dataminer, EPA Envirofacts Database, and NJDEP Bulletin.

DRAFT

The existing treatment facilities, if any, are illustrated on Map 2M.

DRAFT

## Environmental Features

Princeton Township is bordered by Hopewell Township, Lawrence Township, and West Windsor Township and is bisected by US Route 206. The Millstone River, Carnegie Lake, and the Delaware and Raritan Canal border the Township on its northeastern and eastern sides. The Township contains protected open space and recreational areas including but not limited to the following:

- Autumn Hill Reservation
- Barbara Smoyer Memorial
- Community Park North/South
- Grover Park
- Harrison Street Park
- Hilltop Park
- Marquand Park
- Mary Moss Park
- Mountain Lakes Nature Preserve
- Van Dyke Wight Woods
- Witherspoon Woods
- Woodfield Reservation

There are approximately 305 acres in the Princeton Township Agriculture Development Area (ADA). Farmland within the ADA is generally privately owned with publicly-held easements. A specific listing of these farms can be found in the Mercer County Farmland Preservation Plan.

Several small streams including Mountain Brook, Stony Brook, Harrys Brook, and Alexander Creek flow from the north to the south within the Township. Carnegie Lake runs through the southern side of the Township on the border with West Windsor Township. Carnegie Lake discharges into the Delaware and Raritan Canal which borders the southern boundary of the Township.

## Delineation of Service Areas and Planning Integration

### ***Sewer Service Areas***

Following are the sewer service areas within Princeton Township. Existing areas served and future SSAs are shown on Maps 2M and 3M, respectively. The facilities providing treatment to these service areas have an associated facilities table in the Appendix.

- SBRSA River Road (NJPDES NJ0031119) – This SSA encompasses nearly the entire Township.

An explanation of the mapping method used to delineate the SSA is included in Appendix A to this chapter.

### ***General Service Area (Septic Service)***

DRAFT

General Service Areas (GSAs) consist of those areas with planning flows of less than 20,000 gallons for commercial properties or less than 2,000 gallons per day (i.e. residential septic systems) that are neither designated for sewer service nor as non-discharge areas. These areas can be seen in Maps 2M and 3M.

DRAFT

## Future Wastewater Demand and Facilities

For the purposes of evaluating capacity and future sanitary flow rates, the full build-out of undeveloped or underdeveloped land in the Township was derived from existing zoning and the development potential of land parcels within the Township. The results of the build-out were compared to the permitted treatment capacity of major wastewater treatment facilities. This analysis is not required for the minor facilities.

The County used CommunityViz, a land use planning software package offered through Placeways, LLC. CommunityViz is an extension for ESRI's ArcGIS platform that uses existing zoning information to estimate future development. CommunityViz uses zoning data such as minimum lot size and set back requirements to evaluate potential number of future residential units or square feet of commercial space on individual parcels or within the municipality.

The County has identified a category of service indicated as "open with facilities". This category was created in response to a number of comments received from municipalities to include recreational lands, many purchased through public funding, in the Future SSA. The requests pertain to open space properties that currently have support facilities or may have them in the future. The intent of this service type category is to account for up to 2,000 gpd of wastewater generation from these parcels, while recognizing they will continue to function as municipal open space and recreational facilities. The estimated flow has been included in the capacity analysis for the facility serving the closest sewer service area. This category gives municipalities flexibility in planning for essential facilities that support existing and future recreational programming at the local level.

### ***Sewer Service Area Wastewater Capacity Analysis***

Table 2a presents the results of the Build-out Analysis within the SSA indicated above.

DRAFT

**Table 2a: Princeton Township Build-out Table (SSAs)**

NJPDES Permit Number	Major Public Wastewater Treatment Facility	Capacity Allocation/ Permitted Capacity (mgd)	Total Existing Flow (mgd)	Total Flow Attributed to TWAs Approved But Unconnected (mgd)	Residential Build-out Flow (mgd)	Non-Residential Build-out Flow (mgd)	Existing Septic Systems Flow (mgd)	Total Projected Build-out Flow (mgd)	Remaining Capacity (mgd)
NJ0031119	SBRSA River Road STP	FCFS*	1.740	0.052	0.383	0.188	-	2.363	-

\*Refer to Facility Table for SBRSA River Road STP.

DRAFT

Treatment Works Approvals (TWAs) approved by NJDEP for unconnected projects within Princeton Township consist of the following:

**Table 2b – Treatment Works Approvals**

TWA	Facility	Unconnected Flow (mgd)
RushBrook Phase II	SBRSA River Road STP	0.0003
Four Seasons at Princeton	SBRSA River Road STP	0.0232
Gordon Bunn Drive MAB Assoc	SBRSA River Road STP	0.0031
Princeton University New Chemistry Bldg	SBRSA River Road STP	0.0190
Princeton University New Chem Bldg Sewer	SBRSA River Road STP	0.0000
Tenacre Foundation	SBRSA River Road STP	0.0053
Gallup Road Sewer Extension	SBRSA River Road STP	0.0006
Quarry Lane	SBRSA River Road STP	0.0008
<b>Total</b>		0.0523

The capacity of SBRSA River Road STP is shown in the Facility Table. The facility has no formal agreements with regard to allocation of treatment capacity.

With regard to the SBRSA facility, flows are accepted on a first-come-first-served basis from the participant member communities. Princeton Township is a participant member of the SBRSA.

Undeveloped and underdeveloped parcels are shown on Map 3M.

For the most part Princeton University academic buildings are located in Princeton Borough. There should be a sentence that explains that existing (?) and future flows from the Borough are going through Princeton Township lines to SBRSA. Also, there is a Princeton Sewer Committee that serves in some capacity to make decisions about sewers and flows for both Princeton Township and the Boro.

### **General Service Area Wastewater Capacity Analysis**

Table 3 presents the results of the Build-out Analysis within the GSA. The GSA is shown on Map 3M.

The breakdown by HUC11 subwatershed is shown below.

**Table 3 –Princeton Township Build-out by HUC**

HUC	Build-out Potential (Equivalent Dwelling Units)		Surplus/Deficit
	Using Nitrate Dilution Model	Under Municipal Zoning	
02030105090	238.23	5.00	233.23
02030105110	109.26	0.00	109.26

Table 3 shows the variation in build-out results based on existing zoning as compared to the potential EDUs predicted by the Nitrate Dilution Model (NDM). The zoning based build-out and the NDM should be run on a HUC11 basis to determine if the entire HUC has sufficient nitrate dilution capacity to accommodate full zoning build-out.

For Table 3, equivalent dwelling units were calculated by adding [potential residential flow (gpd)/350] + [potential non-residential flow (gpd)/500].

The General Service Area (i.e., septic) build-out capacity analysis for Princeton Township was based on the 2.0 mg/L statewide standard for the target concentration of nitrate in groundwater.

Following are the results of this analysis shown in table 3 for Princeton Township’s portion of the HUC:

- For HUCs 02030105110, no GSA parcels were present in the HUC. So, the Build-out Potential Under Municipal Zoning was zero. However, the Nitrate Dilution Model (NDM) was used to calculate the surplus dilutive capacity of parcels such as open space and environmentally sensitive areas that were not hydric. The calculated surplus can be used to offset deficits within the municipality and within this HUC on a regional basis.
- For all HUCs, the build-out results based on existing zoning are less than the number of potential EDUs generated by the NDM for septic capacity, and therefore, no further analysis of these HUCs will be required nor will any change in zoning be required.

A list of zoning codes and descriptions are included on Map 4M.

DRAFT

## Appendix A – Basis for Service Area Delineations

### SSA (Sewer Service Area)

The SSA designation is for areas from which wastewater is designated to flow to a permitted wastewater treatment facility.

In assigning the SSA designations shown, several data sources were considered:

- Cross-Acceptance proceedings (2004)
- NJDEP’s adopted SSA map for Mercer County (2006)
- NJDEP’s draft SSA map for Mercer County (2008) including revised editions based on public comments received from December 2008 through March 2011; editions of the original 2008 map were reviewed periodically during this period once in June 2009, once in February 2010, and once in November 2010 prior to the NJDEP Public Meeting in December 2010.
- Data (such as collection system extent) obtained from municipalities or private entities.
- Existing TWA permits
- Sewer service areas provided by existing sewerage authorities and wastewater treatment facilities

Parcels that were within previous draft or adopted sewer service areas, or existing sewer service areas provided by sewerage authorities or wastewater facilities, were given the SSA designation, unless specific guidance was provided to remove them. In early 2010, the NJDEP issued Administrative Consent Order 2010-03. Subsequent to adoption of the ACO, all mapping followed the protocol established in the ACO.

Proximity to existing collection system was considered if service for a given parcel was indeterminate based on other criteria.

Parcels with valid NJDEP Treatment Works Approvals (TWA) were automatically given an SSA designation.

### GSA (General Service Area)

The GSA designation represents those areas served by septic systems. For the purpose of mapping, the GSA designation also represents those areas that are not designated as any of the other categories (SSA or Open/Utility as described below).

### Open & Utility (Open Space, Open with Facilities, Utility)

The Open & Utility designation identifies the following:

- Open Space – Mercer County Planning Division maintains an open space layer. The county boundary is the layer’s geographic extent. The open space layer is developed from several sources including a county-owned land inventory, Green Acres ROSI, preserved farmland inventory, municipal open space inventories, and state and non-profit open space inventories. The open space layer served as the basis for identifying undevelopable land designated through the Plan as Municipal, County, or State Land, Deed Restricted properties, Conservation Easements, and certain lands overseen by non-profit entities.

DRAFT

- Open with Facilities - This category was created in response to comments received from municipalities to include recreational lands in the Future SSA. These open space properties currently have support facilities or may have them in the future. This category gives municipalities flexibility in planning for essential facilities that support existing and future recreational programming at the local level.
- Utility - tax assessment data was used to identify lands owned by public utilities.

This designation indicates that these parcels are undevelopable, except for instances where public programs require the construction of public facilities.

## Environmentally Sensitive Areas

The Environmentally Sensitive Areas (ESAs) designation applies to those areas that have been mapped as such by NJDEP. They consist of the following:

- Wetlands – areas based on NJDEP’s Land Use/Land Cover feature class (2002)
- Stream corridors – areas which incorporate the appropriate buffer along surface waters based on NJDEP’s stream classification (2008)
- Natural Heritage Priority Sites – areas of critical importance due to the presence of rare plant species and ecological communities (2007)
- Landscape Project Areas (Rank 3, 4, and 5) – areas representing wildlife habitat mapping for community planning and endangered species conservation. Rank 3 is associated with NJ State threatened species. Rank 4 is associated with NJ State endangered species. Rank 5 is associated with Federal threatened or endangered species (2007)

## Methodology

The following methodology was employed to designate all parcels within Mercer County as either SSA or GSA, except for parcels designated as Open/Open with Facilities/Utility as described above. The following is the general methodology used for preparing the Draft SSA Map.

1. Parcels were evaluated to determine if:
  - a. It was designated under the Mercer County’s open space inventory.
  - b. It was owned by a public utility.Any parcels falling within the above categories were designated as Open/Utility.
2. The remaining parcels were evaluated to determine if they were part of previous approved SSA. If so, these parcels were designated SSA, unless directed otherwise by NJDEP, Mercer County, or the Municipality.
3. The remaining parcels not designated as previously part of an SSA were also evaluated to determine if any existing wastewater generating structures were present onsite using Mercer County’s building footprint (January 2009) layer and aerial photography (2007). County staff further reviewed these parcels with more current aerial photography (2009). COAH and local approvals were also considered in this evaluation. If sewage generating potential was identified, the parcel was further evaluated to determine if it was readily

DRAFT

sewerable by an existing collection system without extending it. If this was the case, the parcel was designated as SSA unless:

- a. A significant portion of the parcel is undeveloped and falls within the constrained boundary AND
- b. Comments were received from NJDEP indicating the constrained portion of the parcel was to be excluded from the SSA.

In cases where a) and b) above apply, the parcel was split along the Constrained boundary. In this case, the portion of the parcel within the Constrained boundary was designated GSA and the remaining unconstrained portion was designated SSA.

4. For parcels not addressed under 1, 2, or 3 above, any vacant lands were evaluated to determine if it was readily sewerable by an existing collection system without extending it. If this was the case, the parcel was designated as SSA unless:
  - a. Comments were received from NJDEP, Mercer County, or the Municipality indicating the subject parcel should be excluded from SSA category. If such was the case, the parcel was designated GSA.
  - b. The parcel was constrained in whole or in part by Environmentally Sensitive Areas (ESA). If this was the case, the portion of the parcel within the constrained boundary was designated as GSA and the remaining unconstrained portion was designated as SSA.
5. Parcels that were not designated under 1, 2, 3, or 4 above were designated as GSA.

DRAFT
