NEW JERSEY PUBLIC UTILITIES
BOARD

Dear NJ Board of Public Utilities,

It's obvious that everyone should desire clean water and energy that does not pollute the place we live, including the ocean we live near or the forests and parks we enjoy. When you update the Master Plan, please accelerate NJ's transition to a safe, clean energy economy. Please help NJ to be a leader increase our efficiency in clean energy by 30% by 2030 and 100% by 2050, as long as we can balance that without increasing our debt or putting a strain on small businesses or the individual consumer. I believe we can achieve it without losing jobs or making it unaffordable for small businesses or consumers, like President Obama's healthcare plan did, forcing everyone to get healthcare or else pay extra taxes or fines.

In addition, please make incentives for businesses to go to clean energy technology. Please make NJ a hotbed for manufacturing, R & D and the installation and maintenance of green technologies to create new job growth.

In addition, as a Bible-believing Christian, we need to put a priority on people. There does not have to be a choice between people or clean energy. God clearly told us in the Book of Genesis to be good stewards of the world He blessed us with, as we are all going to be accountable one day for how we take care of the environment we are blessed in. Jesus came to forgive us of past sins, if we put our faith in Him alone (John 3:16, Ephesians 2:8-9, Titus 2:3-5), then we are saved by His grace and are forgiven of our sins. Once we are forgiven, we are to lead a life of good stewardship for His blessings and to love our neighbor and honor the God Who has given us all things. One way we can do that is to take care of His earth for Him until He either comes back or calls us home, and to also to take care of people, and those people having affordable, clean energy to heat their homes and have clean water to drink and bathe. We can do both!

So I am asking the NJ Board of Public Utilities to please work at helping people by pushing for clean energy for everyone, as God has put you in an authoritative position, for the good of the people. I will be praying for you, your stewardship and for your salvation in Christ alone, as Jesus Christ said, "I AM the way, the truth and the light. NO ONE goes to heaven, except through Me", (John 14:6)

Thank you for your time and your service to our community.

Sincerely,

Christopher Raike

Eatontown, NJ 07724

The 2011 EMP is insufficient as regards climate change mitigation. More needs to be done, and faster - not less done slower. All indications are that the Governor and his administration will continue to ignore this truth in the present (2015) EMP review cycle. Instead of relaxing goals and perverting the definition of "clean energy" to include nuclear and natural gas, we need to be totally "aspirational," setting goals which will challenge all minds in the state to the intellectual and practical achievements of our Einstein and Edison.

350NJ aligns itself with the scientifically based perspective that an atmospheric concentration of carbon dioxide of 350 ppmv is appropriate for sustainable human civilization. Currently, that concentration stands at about 400 ppmv. (CO2Now) This lends extreme urgency to our campaigns to transition the economy from such a heavy reliance on carbon combustion as an energy source.

Observations:

The current Energy Master Plan was adopted in 2011. Since that time, the world has changed. Superstorm Sandy ravaged NJ mere months (October 29, 2011) after the summer hearings on the draft EMP. Price reductions on renewable generation (Parkinson, 2015) and increasing success in other countries in meeting their energy needs wholly with renewable resources (e.g., Denmark) dominate the news. (Nelson, 2015) The domestic nuclear fleet continues to age inexorably (here in New Jersey: Oyster Creek - 46 years; Salem Unit 1 - 38 years; Salem Unit 2 - 35 years; Hope Creek - 29 years). Lessons remain to be learned and applied relative to the Fukushima Daiichi accidents. The Vatican has issued a clear call for renewed respect and concern for the environment. (Francis, 2015) Meanwhile, the aggravated annual recession of Arctic sea ice, the continuing acidification of global oceans, and the dissipation of mountain glaciers - among other effects - amplify with increasing despair the grave global disruptions which humans continue to preside over. We are not in a time of stable ecosystems. We are witnessing collapse - collapse which is caused - to a significant extent - by ourselves.

NJ stands near the back of the line among the US states as regards the use of renewable resources for its energy needs. While, according to the most recent available data (2011) shown at a federal website (US Department of Energy, Office of Energy Efficiency & Renewable Energy, 2015), NJ ranks 20th for statewide energy consumption (kWh basis), the state ranks 47th in electricity generation from renewable energy resources (and 7th for solar generation and 36th for wind generation). Among the group of states including NJ, benchmark states CA and TX, and its neighbors PA and NY, NJ ranks last in terms of overall electricity generated by renewables and last in terms of wind-based electricity generation (by orders of magnitude, here). See the data below. Any celebration of the state's renewables' progress has been falsely advanced.

"Clean Energy in My State" (2011 data; accessed July 24 2015)						
National Rank			GWhr in 2011			
	Overall (non-hydro)	Solar	Wind	Overall (non-hydro)	Solar	Wind
NJ	47	7	36	1,476,770	68,877	10,523
CA	2	1	3	27,413,668	888,829	7,751,837
TX	5	8	1	32,183,133	28,639	30,548,087
NY	4	14	14	5,798,598	6,443	2,828,069
PA	15	9	17	4,885,312	23,144	1,794,465

The current EMP echoes a "renewable portfolio standard" goal of 22.5% by 2020. It is not clear where NJ presently stands relative to this goal. California – a national leader in the deployment of renewable energy – has already achieved levels in excess of 22% in their program and are targeted on achieving 33% by 2020. (California Public Utilities Commission, 2015)

The identified emerging issues for 2015 seem primarily focused on adaptation to the impacts of climate change:

1. Protecting critical energy infrastructure;
2. Improving the Electric Distribution Companies' emergency preparedness and response;
3. Increasing the use of microgrid technologies and applications for distributed energy resources (DER);
4. Creating long-term financing for resiliency measures through the Energy Resilience Bank.

The imperative of mitigation - meaning stabilization of carbon emissions and eventual reduction to 350 ppmv levels - is absent.

At this time, there appears to be little quantitative connection between the state's climate objectives and the energy master plan. One becomes confused tracking various goals, commitments, and statuses between climate programs and the EMP. Further, a direct linkage between climate objectives and energy objectives is not apparent. This is a critical deficiency.

As we know, energy generation and consumption are primary causes of emissions of carbon dioxide (CO₂) – the principle greenhouse gas.

By adding both nuclear energy and natural gas fired energy to the definition of "clean energy" and counting them towards the 70% goal for "clean" energy sources by 2050 (Solomon, 2011), the Administration has perverted the goals of the clean energy program and is shirking its responsibilities to the residents of the state. Rather than using these false approaches to meet our objectives, we need to stretch forward towards truly clean energy.

Natural gas may be a "bridge" - but must remain a short term one, only. Otherwise, its use becomes a bridge to calamity. As has been amply documented, significant methane leakage occurs during extraction, processing, transmission, distribution and use. (Vaidyanathan, 2015) The high global warming potential of methane dictates that the impacts of leakage be included as CO₂e and accounted for in all energy and climate analyses.

Continued reliance on nuclear is imperiling, not stabilizing. The fact that over half of the state's indigenous electrical generation is nuclear is a troublesome realization, given the age of those generators, the impending shutdown of one reactor, the unresolved waste disposal issue, and the substantial risks inherent in nuclear energy.

Mechanisms to begin to account for the societal impacts – costs – of human-caused global warming have been developed. (Social Cost of Carbon, 2015) This component is variously referred to SC-CO₂ and SCC. It is not clear that this non-traditional but now-necessary cost component is included in all economic evaluations relating to energy choices.

The world is changing. New Jersey's Energy Master Plan is not properly aligned with reality and current needs. A total overhaul is urgently needed and is called for.

Suggestions for the 2015 EMP Update:

Let's create a new EMP, to integrate climate stabilization goals with the energy vision for the next decades.

Let's revise the goals of the EMP to explicitly state climate mitigation as a central goal and pervasive focus.

Let's set quantitative CO₂e targets and tweak the energy choices as a dependent variable to those emission targets.

Let's promote environmental objectives ahead of economic ones.

Let's clean up the definition of "clean energy" - as used in this plan - to eliminate both nuclear energy and the long-term use of natural gas.

Let's account for the climate-killing emissions of methane inherent in the exploitation of natural gas in all scenarios which involve the use of that energy source.

Let's include the very real societal costs of carbon emissions in all economic assessments.

Let's boldly stipulate that NJ's electric generation be fossil-fuel-free [FFF] (and nuclear-free) by 2030 and that adequate systems be in place in NJ for FFF transport and heating by 2050.

Let's foster the interagency coordination (BPU, DEP, DOT, NJ-Transit, and others) needed to afford concurrent management of climate emissions as an underlying governmental priority.

In Closing:

We need bold, determined leadership in the energy planning arena. Gone are the days when incremental changes are good enough. We need quantum-change thinking.

Are we going to continue digging ourselves into a deepening pit of fossilized carbon and global warming or are we ready to come up for fresh air and sunshine?

Respectfully,

Jerome Wagner

Dear Secretary,

As a New Jersey resident, I'm writing to ask you to update the Energy Master Plan with much more focus and investment in clean energy and achieving greater energy efficiency, and less dependence on natural gas.

Our state should not invest in building natural gas pipelines that are cutting through communities and some of our most sensitive ecological parts of our state, and that will be obsolete in 50 years. If we move towards energy efficiency measures and developing renewable energy sources, we can greatly reduce our reliance on energy from fossil fuels and protect land, water, and air at the same time!

Sincerely,

r vanstrien

I am particularly upset at the plan to run a gas pipeline through the Pinelands. This is a bad political deal between South Jersey Democrats and Gov. Christie. It will encourage development in the Pinelands as well as set a very bad precedent.

Sincerely,

Walter Koenig

Board of Public Utilities Secretary
PO Box 44 S. Clinton Ave
Trenton, NJ 08625

Dear Secretary,

As a New Jersey resident, I'm writing to ask you to update the Energy Master Plan with much more focus and investment in clean energy and achieving greater energy efficiency, and less dependence on natural gas.

Our state should not invest in building natural gas pipelines that are cutting through communities and some of our most sensitive ecological parts of our state, and that will be obsolete in 50 years. If we move towards energy efficiency measures and developing renewable energy sources, we can greatly reduce our reliance on energy from fossil fuels and protect land, water, and air at the same time!

Do you people ever watch the news? Examples of these pipelines going bad happen all the time at quite a cost. We have enough real things to deal with without creating new disasters and spending tax payer money on crap when you could spend the money in transformational ways that would benefit generations.

Sincerely,

Julie Krasin

Dear Secretary,

As a New Jersey resident, I'm writing to ask you to update the Energy Master Plan with much more focus and investment in clean energy and achieving greater energy efficiency, and less dependence on natural gas.

Our state should not invest in building natural gas pipelines that are cutting through communities and some of our most sensitive ecological parts of our state, and that will be obsolete in 50 years. If we move towards energy efficiency measures and developing renewable energy sources, we can greatly reduce our reliance on energy from fossil fuels and protect land, water, and air at the same time!

It's ridiculous that we even consider this. It only benefits a few people who are profiting from these pipelines while the rest of us assume all the risk with minimal to no benefit. If we just move toward clean renewable energy now we have no risk and all reward for our future.

Sincerely,

Bryan Ottino
