DEFINITIONS

Bridge

A structure greater than 20 feet in length, carrying vehicular traffic or passing over a roadway carrying vehicular traffic.

Note: The National Bridge Inspection Standards published in the Code of Federal Regulations (23 CFR 650.3) give the following definition: A structure including supports erected over a depression or an obstruction, such as water, highway, or railway, and having a track or passageway for carrying traffic or other moving loads, and having an opening measured along the center of the roadway of more than 20 feet between under-copings of abutments or spring lines of arches, or extreme ends of openings for multiple boxes; it may also include multiple pipes, where the clear distance between openings is less than half of the smaller contiguous opening.

Owner

Represents the type of agency that is the primary owner of the structure. State bridges include those bridges owned by DEP and Orphan bridges.

(Note: If more than one agency has equal ownership, this is coded based on the hierarchy of State, Federal, County, City, Railroad, and Other Private.)

Maintenance Responsibility

The name of the agency responsible for the maintenance of the bridge.

(Note: If more than one agency has equal maintenance responsibility, this is coded based on the hierarchy of State, Federal, County, City, Railroad, and Other Private.)

Route Number

The primary State Route number the bridge is referenced against. Other bridge owners have codes assigned that represent them such as 9001-Atlantic County, 9002-Bergen County and so on to 9021-Warren County. Agencies are also assigned codes such as 9036-Garden State Parkway and 9037-NJ Turnpike for example.

Structure Number

This is the seven-digit structure number assigned by NJDOT for use in the Bridge Management System. Other bridge owners may use different numbers for their records.

Name

The name generally describing the structure, usually in the format of Route xxx over yyy (for example: Route 35 over Shark River).

Regular Inspection

This is the full regular safety inspection of the structure which results in the development of an inspection report on the structure condition.

Date of Last Inspection

This is the date of record for the last regular inspection. For most structures, this is the date the structure was inspected. For larger structures, where inspection could occur over several days, weeks or months (the Pulaski Skyway, for example), this would more typically be the first day that the inspection commenced.

Open/Closed Status

This field indicates if the bridge is open or closed to traffic. Closed bridges are not inspected during the period that they are closed to traffic.

Bridge Classification (Structurally Deficient or Functionally Obsolete)

Functionally Obsolete

A bridge is considered to be functionally obsolete if it contains sub-standard geometrical features, such as narrow lanes, narrow shoulders (or a lack of shoulder), poor approach roadway alignment, or inadequate vertical under-clearance

More technically, a bridge is considered to be functionally obsolete if an inspection of the structure results in the assignment of an appraisal rating of three or less for one of the following: deck geometry, under-clearance, or approach roadway alignment, or an appraisal rating of three or less for structural condition or waterway adequacy.

Structurally Deficient

A bridge is considered to be structurally deficient if the deck, superstructure and/or substructure are deteriorated.

More technically, a bridge is considered to be structurally deficient if an inspection of the structure results in the assignment of a condition rating of four or less for one of the following items: deck, superstructure, substructure, culvert and retaining wall, or an appraisal rating of two or less for structural condition or waterway adequacy.

(Note: Any bridge classified as structurally deficient is excluded from the functionally obsolete category. Therefore, if a bridge is both structurally deficient and functionally obsolete, it is classified only as structurally deficient.)

Sufficiency Rating (from 0 to 100)

The sufficiency rating formula is a method of evaluating highway bridge data by calculating four separate factors to obtain a numeric value which is indicative of bridge sufficiency to remain in service. The result of this calculation is a percentage in which 100 percent would represent an entirely sufficient bridge and zero percent would represent an entirely insufficient or deficient bridge.

The intention of this code is to allow the bridge to be ranked for federal funds for bridge replacement or rehabilitation. It is not a direct representation of structural adequacy as a low sufficiency rating does not mean that the bridge is unsafe in any way for its current use.

A bridge with a sufficiency rating of 80 or less and considered structurally deficient or functionally obsolete would be eligible for federal funds for rehabilitation, while a bridge with a sufficiency rating of 50 or less and considered structurally deficient or functionally obsolete would be eligible for federal funds for replacement. In other words, the sufficiency rating is an indication of funding need. The lower the rating, the higher the need for funding
