NRC INFORMATION NOTICE 2014-06: DAMAGE OF INDUSTRIAL RADIOGRAPHIC EQUIPMENT DUE TO FALLING EQUIPMENT AND IMPROPER MOUNTING

ADDRESSEES

All U.S. Nuclear Regulatory Commission (NRC) material licensees possessing industrial radiographic equipment, regulated under 10 CFR Part 34. All Agreement States Radiation Control Program Directors.

All holders of and applicants for a power reactor early site permit, combined license, standard design approval, or manufacturing license under 10 CFR Part 52, “Licenses, Certifications, and Approvals for Nuclear Power Plants.” All applicants for a standard design certification, including such applicants after initial issuance of a design certification rule.

PURPOSE

The NRC is issuing this Information Notice (IN) to inform licensees about the results of a recent NRC staff analysis involving radiographic equipment. It is expected that recipients will review the information for applicability to their facilities and temporary job sites to consider appropriate actions to avoid similar incidents. The NRC provides this IN to the Agreement States for their information and for distribution to their licensees, as they deem appropriate.

DESCRIPTION OF CIRCUMSTANCES

Recently, the NRC staff conducted an analysis of reported events involving radiographic equipment documented within the Nuclear Material Events Database (NMED). The data analyzed covered the period from Fiscal Years 2003 through 2013. The results of the analysis identified a large number of events in which radiography sources could not be retracted because the guide tubes (or drive cables) had been damaged after the sources were extended.
into the non-shielded position. Specifically, the analysis showed that equipment damage resulted either from falling construction equipment which damaged components of the radiographic equipment or when radiographic equipment fell as a result of inadequate placement or support.

A summary of similar event notifications received by the NRC which involved radiographic equipment when guide tubes (or drive cables) had been damaged is listed below. A link to each event’s full report is also provided.

- In 2007, radiographers attached the guide tube to a ladder within a tank, after which the wind blew the ladder over, causing the ladder to fall on the guide tube and put a crimp in the tube. The crimp prevented the ability to retract the source back into the shielded position.

- In 2008, radiographic equipment fell from the radiographers’ vehicle and the guide tube was bent where it attached to the device. The radiographers were able to straighten the guide tube and to crank the source in and out of the equipment with increased resistance. The radiographers continued working with the damaged guide tube. Later in the day, they decided to dismount the device including the guide tube, and when unscrewing the guide tube they noticed the condition of the cable and realized that the source was not in the shielded position.

- In 2012, radiographic equipment fell to the ground from a valve assembly while performing operations. The impact from the fall crimped the guide tube. The radiographer was not able to retract the source into the shielded position due to the crimped guide tube.

- In 2013, a spool fell onto a guide tube during radiography operations, causing crimping of the guide tube. As a result of deformation of the guide tube, the radiography crew was unable to retract the source into the shielded position.

DISCUSSION

Most of these reportable events with radiographic equipment occurred when the source could not be retracted into a shielded position and the source was left exposed. In these cases, the specific causes of the source retraction failures were due to: (1) the falling construction equipment which damaged components of the radiographic equipment, or (2) the radiographic equipment itself falling as a result of inadequate placement or support.

Material licensees and transportation package certificate holders and users, possessing industrial radiographic equipment regulated under 10 CFR Part 34, are being informed of these events to emphasize the importance of the physical hazards which may be present in the surrounding areas. Specifically, when performing radiography operations, construction equipment surrounding the radiographic equipment or inadequate placement of the radiographic equipment may cause damage to the equipment and prevent the retrieval of the source.
