STATE OF NEW JERSEY
BOARD OF PUBLIC UTILITIES
TRENTON, NEW JERSEY

IN THE MATTER OF THE PUBLIC HEARING
NEW JERSEY ENERGY MASTER PLAN

BEFORE: PRESIDENT LEE A. SOLOMON

TRANSCRIPT of the stenographic notes of the
proceedings in the above-entitled matter, as taken by
and before Lorin Thompson, a Shorthand Reporter and
Notary Public of the State of New Jersey, held at
the Statehouse Annex, 125 West State Street,
Committee Room 6, Trenton, New Jersey, on Wednesday,
August 3, 2011, at 1:00 p.m.

1 PRESIDENT SOLOMON: All right, everybody,
2 we're going to get started since we are almost on time
3 which is somewhat unusual for me. I know there are lots
4 of people that aren't even here yet because they know I
5 don't usually get to start on time. We're usually on
6 Solomon time, as opposed to BPU time.
7 Having said that, we're going to get
8 started.
9 Are there enough seats?
10 There's not enough seats.
11 There may be some over here. I would invite

12 you to sit up here, but I'm probably violating some law
13 by doing that.

14 Good afternoon.

15 We're here today to take comments on New
16 Jersey's Draft Energy Master Plan. It was released by
17 the Governor on June 7th of 2011. This is the second of
18 three hearings that we will host.

19 The 2011 Draft Energy Master Plan is a
20 strategic vision for the use, management, and
21 development of energy in New Jersey over the next
22 decade. The specific recommendations in this 2011 plan
23 focus on both initiatives and mechanisms which sets
24 forth energy policy to drive the State's economy forward
25 but do not lose site of environmental protection

5

1 imperatives.

2 Let me just mention to you also that this is
3 a revisiting of the previously drafted master plan. The
4 master plan of necessity is a living document. It is by
5 statute required to be revisited every three years and
6 rewritten every ten. And I simply remind everybody of
7 that because economic conditions change, technology
8 changes, and there may be things that evolve in the
9 future, as they have in the past, requiring us to
10 revisit this.

11 Efforts to promote economic development will
12 include increasing in-State energy production, improving
13 grid reliability, and recognizing the economic,
14 environmental, and social benefits of energy efficiency,
15 energy conservation, and the creation of clean energy
16 jobs.

17 The plan contains five overarching goals:
18 Drive down the cost of energy for all
19 customers. That's the first goal. New Jersey's energy
20 prices are among the highest in the nation. And I
21 remind you that energy costs are generally always
22 virtually the second highest expense of any business
23 enterprise in the State of New Jersey behind only labor.
24 For New Jersey's economy to grow, energy costs must be
25 comparable to costs throughout the region. Ideally,

□

6

1 these costs should be much closer to U.S. averages.

2 The second goal is to promote a diverse
3 portfolio of new, clean, in-State generation.
4 Developing efficient in-State generation while
5 leveraging New Jersey's infrastructure will lessen our
6 dependence on imported oil, protect the State's
7 environment, help grow the State's economy, and lower
8 energy rates. Energy diversity is essential.
9 Concentrating on New Jersey's energy future in any one
10 form of energy is ill-advised. Picking winners and
11 losers should not be the State of New Jersey's job, but
12 formulating incentives to foster the entry of both
13 conventional and renewable technologies is required when
14 market-based incentives are not sufficient.

15 Third: Reward energy efficiency and energy
16 conservation and reduce peak demand. The best way to
17 lowering individual energy bills and collective energy
18 rates is to use less energy. Reducing energy costs
19 through conservation, energy efficiency, and demand
20 response programs lowers the cost of doing business in

21 the State, enhances economic development, and advances
22 the State's environmental goals.

23 Fourth: Capitalize on emerging technologies
24 for transportation and power production. New Jersey
25 should continue to encourage the creation and expansion

7

1 of clean energy solutions while taking full advantage of
2 New Jersey's vast energy and intellectual infrastructure
3 to support these technologies.

4 And, fifth and last, to maintain support for
5 new, renewable energy portfolio standard of 22 and a
6 half percent of energy from renewable sources by 2021.
7 This is the floor set by the Solar Advancement Act.

8 And I may as well mention now, it's always
9 been our position, my position, frankly, that policy is
10 supposed to be set by those elected by the public to set
11 policy, namely, our legislature and our Governor, not by
12 bureaucrats, such as us, who are appointed or hired to
13 carry out that policy, but I'll be happy to listen to
14 anybody who differs from that assessment and would
15 prefer to have the unelected bureaucrats to make all the
16 policy decisions rather than the elected officials.

17 New Jersey remains committed to meeting the
18 legislative targets for renewable energy production. To
19 achieve these targets, New Jersey must utilize flexible
20 and cost-effective mechanisms that exploit the State's
21 indigenous renewable resources.

22 Following the public hearing and comment
23 process, the Energy Master Plan will be finalized.
24 Implementation of the plan will require the support and
25 cooperation of all State agencies, together with energy

1 developers and suppliers, utilities, power plant owners,
2 PJM, our grid operator, the Federal Energy Regulatory
3 Commission, and all levels of government and ratepayers.

4 The Board of Public Utilities has served as
5 the lead agency implementing the agency -- as an
6 implement -- lead implementing agency for this plan. In
7 doing so the BPU will, among other things, coordinate
8 with appropriate State agencies, energy providers, and
9 other stakeholders, track and report on progress and
10 develop or modify existing and future programs that
11 support the goals in the plan.

12 Before we hear from you, let me give you a
13 couple of our expectations for the hearing. As you can
14 tell, we have quite a few people that want to speak,
15 many of whom, I believe far in excess of 50 have already
16 registered to speak. If you have not done so already,
17 please sign in the back of the room and place yourself
18 on the speaker's list. I think the table is over there
19 somewhere, but I can't see it from here.

20 To provide an opportunity for all, I'll ask
21 you to limit your remarks as much as possible. I did a
22 little math, and if math was my forte, I probably
23 wouldn't have been a lawyer, but it was less than four
24 minutes a speaker if everybody speaks. Our intention is
25 to have everybody speak so please use that as your

1 guide, especially if you're in a group. Because if you
2 can defer or refer to other speakers, that will be

3 helpful and give somebody perhaps a little more time.
4 But it's a little more -- it's under four minutes per
5 speaker to get everybody in. Keeping within the time
6 limit will help ensure that everyone has an opportunity
7 to speak today.

8 we have a stenographer, as you can see, so
9 we will have a complete transcript of everything we've
10 said here today, even in the statements I make, which
11 I'm sure I'll read about. I ask that you speak slowly
12 so that she can record your comments. It's very
13 distressing when the court reporter falls over because
14 she's stressed and overtaxed and it usually delays the
15 proceeding.

16 In addition, please print your name clearly
17 on the sign-in sheet if you haven't already done so.

18 When you come up and testify, state your
19 name when you begin to speak, and spell it if you could,
20 who you're representing, if you're representing an
21 organization or an entity.

22 All speakers and attendees are welcome to
23 submit more detailed written comments. Comments are due
24 to the Board by August 25th. That means that if there's
25 something you don't get the say or cut your comments

10

1 short or if I cut you short, you can submit it in
2 writing. We will have time and will read everything
3 that is submitted to us.

4 Instructions for submitting your written
5 comments are on the Energy Master Plan's web page which
6 is at www.state.nj.us/emp/. EMP for Energy Master Plan.
7 Pretty clever.

8 For participants planning to attend more
9 than one hearing, I ask that you limit your comments to
10 only one hearing. If you spoke at our previous hearing
11 up North, please supplement those comments in writing
12 rather than taking up time here today. Once your
13 comments are on the record, there is no reason to repeat
14 them. If comments made by a previous speaker today
15 reflect those that you plan to make, please indicate
16 that so you can keep your comments short.

17 We are here to listen. No decisions will be
18 made at this or any of the other public hearings. We
19 will keep questions to a minimum, unless I really get
20 carried away, limited to only those required for
21 purposes of clarification and will come only from board
22 staff or the hearing officer, which means me, although
23 from time to time the commissioners will have the
24 opportunity to speak to ask a question and I reserve the
25 right to tell them no.

11

1 We will post all comments made at the
2 hearing and those we receive in writing to the Energy
3 Master Plan website. Once again that address is
4 www.state.nj.us/emp/.

5 We have one more public hearing which will
6 be August 11th from 1:00 p.m. to 5:00 p.m. at Stockton
7 College Student Center.

8 Again, written comments should be submitted
9 on or before August 25th of 2011. Following the
10 deadline of August 25th, BPU staff will review all
11 comments received and the process of revising the draft

12 plan will begin. We do not yet have a deadline to
13 announce regarding when the Energy Master Plan will be
14 finalized. We will need time to see the full extent of
15 the comments and have internal discussions. Once we
16 have done that, we will provide a time frame for
17 finalizing the plan.

18 And let me just suggest that the comments
19 that are very important to us -- all comments are
20 important, but the comments that will clearly have an
21 impact are those that relate to inaccuracies,
22 incorrections or corrections needed to the master plan,
23 rather than philosophy. And, frankly, why, what the
24 basis is, and what, in fact, those changes should be.
25 If it is a statistic, a number, a fact, give us the

12

1 correction so that we can investigate, analyze, refer to
2 experts, and make a decision. It would be very
3 important, frankly, that is what I'm hoping most these
4 hearings will do, enable us to understand any
5 inaccuracies or corrections or things that require
6 additional information or thought.

7 Now, the first three speakers we have are
8 members -- Greg is raising his hand. Usually, he's just
9 giving me this, which means stop.

10 There were a number of assembly people that
11 signed up. I only currently see Assemblyman DeAngelo.

12 Come on up, Assemblyman, if you would.

13 I know they have various matters they are
14 attending to in the Statehouse as we speak so I plan on
15 calling them first.

16 Apparently, you're the only one here.

17 Obviously, the others heard that I'm often late.

18 So Assemblyman I ask you to identify
19 yourself for the record.

20 ASSEMBLYMAN DeANGELO: Sure.

21 Wayne DeAngelo, State Assembly, District 14.

22 Good afternoon, everyone.

23 Thank you for this opportunity to speak
24 before you here today.

25 During the course of these public hearings

13

1 and other reviews of the Draft Energy Master Plan, we
2 need to ask a couple questions about potential for job
3 growth. As someone who has not only had the honor to
4 serve in the State Legislature, I have also spent my
5 entire professional career in the trenches of the energy
6 industry as a union electrician. So I watched closely
7 at this Energy Master Plan come to fruition.

8 Much of what you will likely hear during
9 these public hearings will be about the impact on the
10 industry, the impact on the environment, and the impact
11 on the energy cost paid by consumers. All of these are
12 important concerns to take into consideration, but in my
13 estimation you need to look at this plan, to the length
14 of the impact, and emphasis on job creation.

15 The Energy Master Plan's executive summary
16 lays out five specific goals to the plan. None of the
17 goals listed is job creation and new and emerging
18 renewable energy industries. I find that deeply
19 troubling given the economic condition of our State and
20 the high unemployment rate that we continue to face.

21 This plan is not just about how we intend to
22 use and distribute energy in the coming years. It needs
23 to be a catalyst to keep our State as part of the task
24 force economic recovery for our State. Since our State
25 Energy Master Plan provides a blueprint for the future

14

1 intention to develop energy sources and conserve
2 existing energy resources, this document needs to
3 provide a thoughtful road map toward extensive job
4 creation and connected industries.

5 The growing renewable energy industry
6 supports the countless building and construction trade
7 sectors that can be the backbone of developing new
8 facilities. By committing to growth in the energy
9 industry, we can put thousands of middle class men and
10 women back to work, particularly in trades that can have
11 upwards of 25 percent unemployment. The plan does not
12 seem to list the number of jobs ultimately provided by
13 the embracing individual new, renewable energy
14 industries.

15 It is critical that we know what the job
16 impact of this plan will be before it is set in stone as
17 a permanent working guide. Job creation estimates tied
18 to the plan's goal for each renewable energy field would
19 help decision-makers determine how to prioritize
20 incentive programs for emerging industries.

21 New Jersey is a center for creating solar
22 energy projects in our State is one of the reasons why
23 we are a national and international leader in solar
24 energy, number two in our country and seventh in the
25 world. And how, when we look around our State and see

1 so many projects ready to go, such as two massive
2 projects, one in East Windsor and another west Windsor,
3 Mercer County; noting the completion of a 5 megawatt
4 project attached to Hamilton and the starting of an 8.8
5 megawatt project in Hamilton as well.

6 I am concerned that while we sit here today
7 and consider the Energy Master Plan, we are considering
8 rolling back benefits for solar energy creation. Doing
9 so will destroy these projects, thereby, hindering the
10 creation of thousands of jobs for working class men and
11 women.

12 Again, the master plan talks about solar
13 installation to provide economic and environmental
14 benefits, but we need to start stressing the job
15 creating potential of these projects. We are on the
16 bridge of stopping large scale projects before they can
17 even start. Just as New Jersey is known for being a
18 catalyst for thousands of jobs in the pharmaceutical,
19 ranging from researcher to sales associates to business
20 personnel, we can make New Jersey the center of
21 renewable energy when it comes to the thought of an
22 applicable job. The job created by one major solar
23 installation can run a gamut of professions.

24 I am also concerned about how the state
25 plans to handle the impact of thousands of lost jobs

1 when Oyster Creek nuclear plant closes in 2019 without
2 another nuclear facility reopening in its place. We are

3 going to have hundreds of highly skilled professionals
4 out of work and looking for new jobs in order to put
5 food on their tables. We cannot sit by and wait until
6 2019 is upon us. We need to start thinking about
7 creating alternative job opportunities now.

8 The master plan also talks about adding
9 energy efficiency goals and New Jersey building codes.
10 I believe that again changes to the State's guiding
11 documents must be done with job creation goals in mind.
12 And any changes must be done with the full participation
13 of the experts in the building trades industry to ensure
14 that the energy efficiency guidelines set forth are
15 realistic.

16 Finally, the program discusses the increase
17 of education and outreach to consumers about the
18 importance of energy efficiency. Why not enlist the
19 support of men and women whose jobs are directly linked
20 to renewable energy markets to spread the word. The
21 State needs to partner with the corporate entities who
22 have financial stake in the renewable energy market, but
23 also with those men and women who have a financial stake
24 in their paychecks connected to these industries.

25 Thank you very much for the opportunity to

17

1 speak to you today and hope that you consider the
2 revision of the draft plan to take a more specific look
3 at job creation and plan adoption.

4 I know one of the speakers coming up shortly
5 after me is Ed Grant, the business manager of the
6 International Brotherhood of Electrical Workers,
7 Local 351. He will discuss with you specifically the

8 job creation as before.

9 Thank you.

10 PRESIDENT SOLOMON: Thank you, Assemblyman.

11 I know Commissioner Asselta had a question.

12 COMMISSIONER ASSELTA: Assemblyman, a little
13 bit of elaboration on the nuclear issue, how many jobs
14 and also the spike in solar in the last year or two,
15 just some kind of --

16 ASSEMBLYMAN DeANGELO: Sure. Absolutely.

17 Looking at the plant, Oyster Creek -- and
18 right now there's hundreds of men and women that are
19 working there on a day-to-day basis. When that's
20 decommissioned in 2019, we're not only going to be
21 losing the upwards of 600 megawatts worth of energy
22 generation, but those individuals, men and women, that
23 are specifically trained to work in nuclear power plants
24 or powerhouses in general will be at a loss of jobs. It
25 takes much longer in order to start and have a new nuke

18

1 plant put forth.

2 I know some of the energy needs in New
3 Jersey and I know that we generate approximately
4 80 percent of our electrical needs. So as we're going
5 forth and talking about partnerships with energy
6 efficiencies to reduce that burden, but we're going to
7 be losing in a couple of years a large generator.

8 Solar has been a life-saving resource in the
9 past five years. Right now I can speak from my
10 individual local, Local 269, we have approximately -- we
11 had approximately 25 percent unemployment. And during

12 the summer months, that's unheard of. We've experienced
13 this unemployment in construction in general, you know,
14 25 to 30 percent for the past couple of years when the
15 state average is slightly under 10 percent. But these
16 jobs, they last anywhere from five to six months,
17 depending on the size of the project, have given hope to
18 hundreds of families in the greater Mercer County area,
19 statewide thousands.

20 You know, whether it's construction in
21 general, it's just based on short-term type of work.
22 It's not jobs where you're consistently there. We go
23 job to job and these jobs give families hope.

24 PRESIDENT SOLOMON: I don't want to
25 interrupt, but that's kind of what we don't -- that's

19

1 not a reflection, you answered the question -- is to get
2 into that kind of back and forth. It doesn't
3 necessarily directly relate to the master plan.

4 The only comments I would make is I would
5 take a hard look under Section 7 which talks about
6 innovative technologies and businesses and how we like
7 to take advantage of it, and there are a number of
8 sections, I'm not going to cite them, but right at the
9 very beginning, the second paragraph of the first page
10 it talks about job growth.

11 So there's a fair discussion of it and
12 there's even a footnote that talks about what to do
13 potentially for Oyster Creek because that is a concern
14 of jobs and the energy supply.

15 So there is a discussion of those things and
16 maybe there needs to be more specificity and we can

17 certainly take a look at that.

18 And I do appreciate your comments.

19 ASSEMBLYMAN DeANGELO: Thank you very much.

20 PRESIDENT SOLOMON: Thank you.

21 ASSEMBLYMAN DeANGELO: Have a great
22 afternoon.

23 PRESIDENT SOLOMON: You too.

24 Michael Egenton, New Jersey State Chamber of
25 Commerce.

20

1 MR. EGENTON: Michael Egenton,
2 E-g-e-n-t-o-n, Senior Vice President, New Jersey State
3 Chamber of Commerce.

4 Thank you President Solomon and fellow BPU
5 Commissioners for allowing us the opportunity to provide
6 our input on the Energy Master Plan.

7 I'm Michael Egenton, Senior VP, Government
8 Relations for the State Chamber.

9 Since 1911 the State Chamber has been
10 recognized as the independent voice of business in New
11 Jersey. We have a broad based membership --

12 PRESIDENT SOLOMON: Take your time.

13 MR. EGENTON: Okay.

14 We have a broad based membership ranging
15 from the Fortune 500 companies to the small
16 proprietorships, the mom and pops, representing every
17 corner of the State and every industry. We continue to
18 work towards streamlining the regulatory process while
19 striving to maintain the economic vitality of our
20 members and the quality of life that makes New Jersey

21 unique.

22 Energy is the lifeblood of the economy.
23 Reliable, safe, reasonably priced, and environmentally
24 sound energy supply is essential for New Jersey's
25 economic progress. In that regard the State Chamber

21

1 supports the goals outlined in the Draft Energy Master
2 Plan, a business friendly EMP that is realistically
3 achievable.

4 The EMP sets very reasonable and attainable
5 goals in its blueprint for New Jersey's energy future.

6 The five major goals set out in the draft
7 plan are: It promotes a diverse portfolio of new, clean
8 in-State generation; starts the process of stabilizing
9 energy costs for all customers; rewards energy
10 efficiency and energy conservation in reducing peak
11 energy demand; fosters emerging technologies for
12 transportation and power production; supports New
13 Jersey's renewable energy portfolio standard by
14 producing 22.5 percent of energy from renewable sources.

15 State chamber supports a balanced approach
16 towards achieving these goals that doesn't depend or
17 rely on one method, one technology, one fuel source, or
18 overburden one segment of the economy or a group of
19 energy consumers.

20 The State Chamber also believes that
21 competitive wholesale and retail energy markets continue
22 to deliver benefits to the state and that
23 well-structured competitive markets will provide the
24 best pathways to reaching the State's goals.

25 with that in mind, I want to take the

1 opportunity to briefly to highlight some of the specific
2 energy sectors our organization believes must be on the
3 table as the State of New Jersey prepares for energy
4 needs of business communities and residents in outlying
5 years.

6 with regard to in-State generation, the BPU
7 has raised concerns regarding the reliability of our
8 electric supply. We would suggest PJM, the BPU, and the
9 energy providers and stakeholders work together to
10 analyze and review long-term costs, impact on future
11 investment, and the possibility of any unintended
12 consequences.

13 State chamber recognized that electric
14 transmission resources are essential to maintain the
15 reliability, efficiency, and safety of the electric
16 system. Transmission additions and upgrades are also
17 elements of a balanced approach to meeting the needs of
18 energy consumers. The ability to move power throughout
19 the state and the region and to resolve congestion on
20 the system that effects reliability and increases cost
21 remains an important goal.

22 New transmission construction also is an
23 economic driver in its own rights that will create jobs
24 directly and through associated economic activities.

25 That is why the State Chamber has actively

1 supported the Susquehanna/Roseland transmission upgrade
2 because it's so critical to the future success of our

3 August 3-2011 EMP Public Hearing.txt
economy and the energy needs of our systems.

4 with regard to nuclear, nuclear power is the
5 most vital source of low-cost, clean, carbon free,
6 baseload electric generation in the State. with the
7 retirement of Oyster Creak in 2019, the plan for
8 supplementing that lost energy source needs to start
9 now. we are pleased that the draft EMP recognizes the
10 benefits of nuclear power and acknowledges the
11 importance of developing new nuclear generating capacity
12 in New Jersey.

13 New construction and a new reactor will gain
14 approximately 4000 peak construction jobs and create 400
15 to 700 permanent jobs. The State Chamber is ready and
16 willing to work with the State and the energy industry
17 to encourage and facilitate new nuclear generating
18 capacity.

19 with regard to natural gas, it is
20 economically efficient and considered a clean, safe, and
21 reliable source of energy. Natural gas is used for
22 heating, cooling, and several other industry uses. The
23 Draft EMP recognizes the important contributions the
24 increase use of natural gas can bring to New Jersey
25 residents and businesses.

24

1 Fortunately, shale gas discoveries
2 throughout the United States have enabled developers to
3 bring significant new domestic natural gas supplies to
4 consumers.

5 This will help our state in four ways:

6 Electric generation: New Jersey is short on
7 electric generation capacity. The draft EMP supports

8 the development of 1500 megawatts of gas-fired CHP.

9 Reduced air emissions: Natural gas is
10 50 percent cleaner than coal, 30 percent cleaner than
11 oil, and direct use of natural gas in a home results in
12 energy consumption that is 28 percent less than a
13 similar home with all electric appliances.

14 Transportation fuel: Increased development
15 of natural gas resources will open the door to the
16 utilization of natural gas as a transportation fuel,
17 especially in fleet vehicles.

18 And, finally, price: In the last four years
19 the cost of natural gas has come down as much as
20 50 percent. And just as importantly, increase of supply
21 of domestically produced natural gas will keep prices
22 stable.

23 The draft EMP also encourages local natural
24 gas distribution companies to update and expand their
25 distribution systems. This will allow businesses and

25

1 residents to take advantage of high efficiency natural
2 gas appliances that can reduce energy costs and improve
3 the air we breathe.

4 with regard to energy efficiency, the State
5 Chamber recognizes the importance of energy efficiency
6 to achieving business and environmental goals. For
7 businesses, using energy more efficiently saves money,
8 reduces operating costs, increases competitiveness, and
9 promotes job retention and creation.

10 In previous years the State has focused
11 energy efficiency programs and funding on residential

12 customers. The State Chamber would respectfully welcome
13 development of additional energy efficiency programs
14 aimed at commercial and industrial customers that could
15 help deliver the benefits we mention.

16 Also, in order to walk the walk, state and
17 local government must lead by example and pursue efforts
18 to reduce energy demand in buildings.

19 solar and wind: solar energy is clean,
20 renewable, and sustainable and should represent a
21 significant portion of the state's renewable portfolio.

22 Our State now has 10,086 solar rays
23 installed adding more than 40 megawatts of energy
24 capacity to the state's 380 plus megawatt total.

25 The State Chamber also supports the Draft

26

1 EMP objectives to encourage solar development at sites
2 such as landfills, brownfields, warehouses, and
3 government facilities that provide potential for larger
4 installations, improved economies of scale, that return
5 unproductive or underutilized sites to societal use.

6 while there are no guaranteed assurances
7 that the State can rely on the availability of both
8 solar and wind, the State needs to enhance our baseload
9 capacity as a backup. We understand that several
10 developers have expressed interest in building wind
11 farms off the coast of New Jersey. The State Chamber
12 believes the State should utilize their economic
13 development team to attract offshore wind manufacturers
14 to the State.

15 while we also recognize that New Jersey has
16 great offshore wind potential, the State must undergo an

17 extensive analysis and evaluate the economic benefits.

18 We support the BPU's due diligence process
19 to safeguard the interest of ratepayers, making sure
20 that we avoid any undue economic burdens. We would also
21 further suggest that the State engage our local and
22 regional chambers of commerce, particularly the ones
23 along the New Jersey coastal areas when such projects
24 are under consideration.

25 A few words on energy from waste. It's a

27

1 proven technology that converts municipal solid waste
2 into baseload energy. Energy from waste facilities are
3 highly efficient and clean power plants that utilize
4 municipal solid waste as fuel, rather than landfilling
5 waste and mining coal, oil, or natural gas. There are
6 currently 86 such energy from waste facilities operating
7 in the United States, including five in New Jersey with
8 a combined capacity of 173 megawatts.

9 The State Chamber strongly agrees with the
10 Draft EMP which advocates for the expansion of energy
11 from waste industry. We applaud the plan's advocacy of
12 utilizing solid waste as a resource in energy from waste
13 facilities and the State should include energy from
14 waste in Tier 1 of the renewable portfolio standards.

15 PRESIDENT SOLOMON: Mr. Egenton, we are way
16 over.

17 MR. EGENTON: I'll wrap up. Just less than
18 two minutes.

19 Biomass is a renewable low carbon
20 sustainable fuel that generates lower levels of

21 atmospheric pollutants. We obviously advocate an
22 increase in the use of biomass. Same with fuel
23 technology. It's the only -- the only by-product from
24 fuel cell technology is water. We encourage the State
25 to work with our fine academic institutions in pursuing

28

1 fuel cell technology as another viable option.

2 Finally, Mr. President, just a few very
3 brief words on the Governor's decision to withdraw from
4 RGGI, the Regional Greenhouse Gas Initiative.

5 We agree with the Governor's decision.
6 While we recognize that there have been reduced
7 emissions in recent years, it has been attributed not
8 necessarily to RGGI, but to reductions in energy use
9 which came from the downturn in the economy and
10 increased --

11 PRESIDENT SOLOMON: I'm not sure that's in
12 the master plan, RGGI.

13 MR. EGENTON: Yes.

14 PRESIDENT SOLOMON: So maybe we can skip
15 over that.

16 MR. EGENTON: All right.

17 PRESIDENT SOLOMON: For the last few words.

18 MR. EGENTON: Right. Last few words.

19 Obviously, we've laid out a pretty
20 diversified portfolio. We applaud the efforts of the
21 BPU including a lot of everything that should be on the
22 table.

23 We look forward to the continuation in this
24 process, and thank you very much.

25 PRESIDENT SOLOMON: You're very welcome.

1 And I especially need to do that because
2 when I cut short somebody who has more criticism of what
3 we did, I want you to remember that I cut short
4 Mr. Egenton.

5 Thank you very much.

6 MR. EGENTON: Thank you, sir.

7 PRESIDENT SOLOMON: Don Lynch.

8 Good afternoon.

9 MR. LYNCH: Good afternoon.

10 My name is Don Lynch, President of Jersey
11 Central Power and Light.

12 President Solomon, Commissioners, JCP&L
13 appreciates the opportunity to provide comments today on
14 the New Jersey Energy Master Plan draft.

15 The document's breath of scope is a
16 testament to the thoughtful hours committed by the Board
17 of Public Utilities and to the staff to the development
18 of this plan which really establishes a direction for
19 the State's energy policy for the next ten years.

20 JCP&L supports the high level goals of the
21 EMP. The company believes that the 2011 iteration of
22 the plan generally lays out an approach that strikes an
23 appropriate balance among the sometimes competing
24 objectives of lower costs, economic growth, energy
25 independence, and environmental protection.

1 The company agrees with the plan's
2 underlying principle that renewable or energy efficiency

3 programs or projects should be expected to produce net
4 benefits that will outweigh the costs of the
5 initiatives. Indeed, the application of properly
6 structured cost-effectiveness test will help New Jersey
7 achieve the plan's stated objective of reducing costs to
8 utility customers, while maintaining strong delivery
9 infrastructure. Such an approach will enable the State
10 to pursue its clean energy initiatives through
11 sustainable and affordable programs without imposing
12 excessive or unnecessary costs on consumers.

13 JCP&L also supports competitive wholesale
14 energy and retail electric markets. The company
15 believes that these markets are functioning properly and
16 are lined with the EMP objective to lower energy costs
17 to consumers.

18 In particular, the basic generation service,
19 BGS auction, are designed -- as designed has produced
20 beneficial results for customers who do not chose an
21 alternative electric supplier. The company believes
22 that unfettered competition and the efficient
23 functioning of the market should ultimately determine
24 winners and losers within the marketplace.

25 In addition, JCP&L supports the concept of

31

1 the energy efficiency utility or EEU to deliver energy
2 efficiency programs that have been thoughtfully
3 considered and carefully implemented. Efficiencies can
4 be gained through statewide implementation and
5 coordination which likely would result in lower program
6 costs to consumers.

7 JCP&L also urges that over the longer term
Page 26

8 consideration be given to implement more stringent
9 building codes which could provide an alternative to
10 program subsidies by means of increasing the adoption
11 rates for energy efficient technologies.

12 Further, the company encourages the BPU to
13 consider extending the expiring market manager contracts
14 for energy efficiency programs to provide continuity
15 during the transition to the EEU model.

16 With respect to smart grid implementation or
17 advanced meter infrastructure, or AMI, JCP&L urges a
18 cautious approach. JCP&L's integrated distributed
19 energy resource or IDER demonstration project done in
20 conjunction with the Department of Energy and with the
21 support of the BPU and rate counsel is an example of
22 such a cautious approach and will enable us to learn how
23 smart grid projects can be used to improve our energy
24 usage.

25 Consistent with the goals of the EMP,

□

32

1 additional investments should be pursued judiciously,
2 only after an appropriate cost-effectiveness analysis.
3 We also can learn a great deal from initiatives in other
4 states, and those lessons can help us maximize the
5 benefits and efficient deployment of those technologies.

6 The EMP directly points out there are
7 numerous challenges and barriers to smart meter
8 implementation, including the increased expense and lack
9 of a standardized communication platform. We must move
10 forward cautiously and consider the overall value of
11 these projects. To the extent smart grid and AMI

12 projects are undertaken, utilities should be able to
13 fully recover the associated capital and operating costs
14 as they are incurred.

15 Consistent with the EMP, JCP&L recognizes
16 the importance of managing peak load and supports
17 cost-effective demand response programs, such as JCP&L's
18 previously mentioned IDER program.

19 The company has registered approximately
20 22,000 customers with a demonstrated demand reduction
21 capability of approximately 27 megawatts through
22 July 2011. This capability is expected to have a
23 positive impact on capacity and energy prices which
24 should benefit all customers, regardless of whether they
25 participate in the IDER program, primarily due to

33

1 anticipated lower BGS costs. In addition, New Jersey's
2 utilities benefit from better load management during
3 periods of high demand.

4 Turning to the topic of distributed electric
5 generation, with a proliferation of this technology, the
6 electric grid is being used in ways which was not
7 initially designed nor intended. For example,
8 distributed generation resources often increase
9 investments required to maintain the reliability and
10 stability of the electric grid.

11 Therefore, JCP&L believes that it would be
12 inappropriate to adopt proposals for community and
13 aggregate net metering, especially virtual net metering
14 for distributed generation without appropriately
15 compensating the distribution utility for its cost to
16 maintain and upgrade distribution circuits that serve

17 these behind-the-meter projects. Adoption of these
18 proposals would spread the cost of these projects over
19 all customers, even though it's not directly benefitting
20 from these initiatives, resulting in the improper
21 shifting of costs for participants and nonparticipants.

22 The EMP should equitably promote the
23 expansion of electric transmission and natural gas
24 transmission. JCP&L supports the expansion and
25 reinforcements of the gas pipeline system to make

34

1 natural gas available in areas where it was previously
2 inaccessible and to the extent it lessens New Jersey's
3 reliance on foreign oil as a transportation fuel.

4 At the same time it should be recognized
5 that the expansion and reinforcement of the transmission
6 grid will enhance reliability and will likely help
7 reduce regional congestion which could also benefit
8 consumers in the form of lower prices. Likewise,
9 improvements to the distribution and subtransmission
10 systems also will help reduce congestion on a localized
11 basis while providing energy savings to reduction in
12 market losses.

13 In closing, JCP&L believes that the Draft
14 EMP generally strikes a reasonable balance between
15 maintaining New Jersey's position as a leader in clean
16 energy and moderating costs to consumers. The EMP also
17 capitalizes on the intrinsic opportunities for economic
18 development through the State. As such, the Draft EMP
19 provides a fundamentally sound platform that we can
20 build on to achieve the State's goal for energy, the

21 environment, and the economy over the next decade.

22 Thank you, again, President Solomon, for
23 your consideration of Jersey Central's perspective on
24 this important issue.

25 PRESIDENT SOLOMON: Thank you.

35

1 Farley Hunter.

2 Farley Hunter.

3 Good afternoon.

4 MR. HUNTER: Good afternoon.

5 My name is Farley Hunter. I'm the
6 Chairperson for the New Jersey Large Energy Users
7 Coalition. I'd like to give our comments for the Energy
8 Master Plan.

9 New Jersey Large Users Coalition
10 congratulates the administration on developing a
11 realistic plan that addresses this State's energy needs.
12 This plan reflects the fundamental understanding that
13 energy policy has a direct impact on economic
14 development jobs and the cost of operating a business in
15 New Jersey. Realization of the New Jersey energy plan
16 will drive reduced cost to consumers, increase
17 efficiency and promote solutions that make sense in a
18 standard cost-benefit analysis.

19 The State's greenhouse gas reduction goals
20 are best met through energy efficiency projects.
21 Studies, along with our own member's experience, affirm
22 that energy efficiency projects are more cost-effective
23 than renewable power generation providing greenhouse
24 house gas reductions. That said, some large using
25 intensive industries, manufacturing process like still

1 making have exhausted available technologies that
2 achieve cost-effective reductions in consumption. These
3 customers should not be subsidizing other projects
4 through utility providers. This results in a
5 consumption tax, not an incentive to improve.

6 New Jersey Large Energy User Coalition
7 supports the administration's efforts and generation in
8 the State, along with the necessary transmission
9 infrastructure to alleviate high marginal pricing and to
10 ensure adequate electric supplies.

11 The Board of Public Utilities recently
12 approved a large energy user self-funded pilot to foster
13 greater participation in the Clean Energy Program by
14 large energy users. The pilot development --

15 PRESIDENT SOLOMON: I don't mean to
16 interrupt you but, Greg, could you ask the people
17 outside to keep it down?

18 Go ahead. I'm sorry.

19 MR. HUNTER: No problem.

20 The pilot development reflects the sector's
21 ability to leverage this inherent expertise in
22 delivering energy efficiency and it should be expanded
23 into a formal program.

24 The Clean Energy Program proportion of the
25 societal benefits charge should be converted to a

1 self-sustained revolving fund. The current approach
2 represents a multimillion dollar hidden tax on large

August 3-2011 EMP Public Hearing.txt
3 business. Funding solar through the sale of solar
4 renewable energy certificates has brought New Jersey
5 into the forefront of solar nationwide.

6 Look at the significant number of systems
7 installed since the State's decision to go to SREC only.
8 This is private equity at work. The current solar
9 alternatives compliance payment was set too high and
10 provides greater economic return for solar PV projects
11 than was originally intended. Gracious incentives are
12 inadvertently causing consumption of developable land
13 for solar PV generation when solar panel placement
14 should only occur in or on otherwise stranded resources,
15 such as roof tops, parking areas, and brownfields.

16 A conservative approach should be used in
17 setting the SACP going forward as it can go up, but it
18 can't go down. The cost approach -- sorry -- the cost
19 of SRECs is passed along to the consumers, particularly
20 large energy using companies. There needs to be limits
21 placed on this negative financial impact and inadvertent
22 consumption of otherwise developable land.

23 Co-generation provides higher efficiency
24 than electricity from the grid as the ways it is used
25 locally. The New Jersey Energy Master Plan should

□

38

1 recognize the strategic value of promoting the
2 installation of new generation capacity within the State
3 as good for the environment and good for the electric
4 grid reliability. Co-generation provides significant
5 greenhouse gas reductions relative to conventional
6 remotely electricity production and distribution and
7 does so more economically than solar PV and wind.

8 The current trends in the design of customer
9 rates recovers the fixed cost of renewable electric
10 supply, demand response, and energy efficiency on a
11 variable kilowatt hour. That's kwh. This is unfair to
12 commercial and industrial customers, inconsistent with
13 historical regulatory practice, and is unnecessarily
14 eroding New Jersey's competitiveness.

15 New Jersey Large User Coalition recommends
16 fixed costs to the electric supply infrastructure --
17 that is, generation, transmission, and distribution --
18 should be charged to customers based on each customer's
19 contribution to the system peak demand. This
20 coincidence peak allocation principle rewards customers
21 who consume less power during high peak periods,
22 especially hot summer days, and provides a strong
23 incentive to business customers to shift consumption
24 away from these peak periods. Capacity charges are
25 already assessed in this manner.

39

1 In closing, we recognize that the State of
2 New Jersey has the sixth highest electric cost in the
3 country. We appreciate that the New Jersey Energy
4 Master Plan intends to evaluate and rationalize all
5 aspects of energy policy. This should improve our
6 record going forward and will make the State more
7 business friendly by lowering our direct cost while
8 preserving system reliability.

9 PRESIDENT SOLOMON: Thank you.

10 I just have one quick question.

11 MR. HUNTER: Certainly.

12 PRESIDENT SOLOMON: When you say that the
13 generation transmission distribution costs should be
14 based upon peak demand or basically energy used at peak
15 times, is that possible without going to a realtime
16 pricing system or would it require that?

17 MR. HUNTER: I don't believe it would
18 require a realtime pricing system currently. The
19 capacity charges are assessed in this manner: They look
20 at the five peak periods of the last year and then they,
21 based on some calculations, provide each ratepayer with
22 the cost of that capacity so it doesn't require us being
23 realtime focus.

24 PRESIDENT SOLOMON: The fixed cost for
25 generation transmission distribution would be based upon

40

1 that same calculation.

2 MR. HUNTER: Yes. Exactly.

3 PRESIDENT SOLOMON: Okay. Thank you.

4 MR. HUNTER: Thank you.

5 PRESIDENT SOLOMON: Thomas Kiley.

6 I don't see anybody.

7 Thomas Kiley here?

8 Robert Mitchell.

9 MR. MITCHELL: Good afternoon.

10 My name is Bob Mitchell. I'm the CEO of the
11 Atlantic Wind Connection.

12 Many of you know of this wind program
13 proposal as the Google project. Google is, in fact, an
14 investor in the project. It is a proposal to build a
15 subsea cable project to support offshore wind over a
16 10-year period. It's a private sector proposal. It is

17 not seeking government subsidies from the State or from
18 the federal government.

19 It is intended eventually to support as much
20 as 7000 megawatts of offshore wind. It is intended to
21 have the first leg of this five leg development to be in
22 the Delaware/New Jersey area. It has significant
23 benefits. And if we had a half an hour, I would be
24 happy to go through all of that.

25 PRESIDENT SOLOMON: See if you can shorten

41

1 it to about three or four minutes.

2 MR. MITCHELL: I'm going to. And I
3 congratulate you for moving that along and doing that
4 with humor.

5 I will say that as an independent
6 transmission developer across the nation dealt with many
7 states, I don't know of any state that has devoted the
8 amount of attention that you folks have to a master
9 plan. I really congratulate all of you for doing that.

10 PJM is recognized in the master plan as
11 playing an essential role. I suggest that it's
12 appropriate to even highlight a greater role for them.
13 They play a critical role in deciding what is going to
14 be the transmission solutions in New Jersey.

15 And, currently, PJM is looking at massive
16 development of off -- excuse me -- of onshore wind in
17 the Midwest. And that is not a positive thing for New
18 Jersey and other East Coast states. What it means is
19 that -- the plan is that considerable thousands of
20 megawatts would be moved from the Midwest to New Jersey

21 and that you would be paying for it, but you would not
22 get the benefits of the economic development associated
23 with that.

24 I would like to point out that PJM is being
25 extremely sensitive to this issue and supportive of

42

1 looking at an offshore wind backbone project. So it's
2 not met with criticism, but it is the reality that only
3 a couple of offshore wind developers have filed for
4 interconnection requests and that is the kind of thing
5 PJM has to be based on their decisions.

6 I think that it is not out of order for us
7 to invite you and others in New Jersey to think about
8 expressing to PJM your support for offshore wind. The
9 goal of getting a few thousand megawatts off the coast
10 of New Jersey and to examine whether or not the Atlantic
11 wind Connection, the backbone transmission project, is,
12 in fact, the most effective way to deliver that wind.

13 Our analysis shows that for the first leg to
14 support up to 2,000 megawatts of offshore wind. The
15 cost for radio lines where each individual wind farm
16 would build their own lines would be about 1.7 billion
17 construction cost. The backbone for the first leg would
18 be 1.6. So essentially it's an apples-to-apples
19 comparison.

20 But then you have to look at what are the
21 benefits that come. And we've heard previous speakers,
22 and I'm sure others that will follow, talk about
23 reliability. And because the backbone is connected to
24 the grid as a network -- as part of the network system,
25 it provides considerable additional reliability.

1 And we have to look at the overall cost, my
2 last comments. We have to look at the overall costs.

3 Yes, offshore wind is expensive. One of the
4 more expensive. But you have to look not only at the
5 top line, but the bottom line. Because of offshore wind
6 and the accompaniment of the backbone transmission line,
7 there will be significant other benefits, \$17 billion of
8 LMP savings, some twelve thousand billion of -- not
9 thousand -- 12 billion -- make sure you correct that --
10 \$12 billion of production costs savings assuming that
11 PJM allows that.

12 And so if you think about the fact that
13 ratepayers in New Jersey are from one year to another
14 paying as much as a billion to \$2 billion in congestion
15 costs, that's a hidden tax on everybody, and if you
16 improve the transmission and reduce the congestion, such
17 as what the Atlantic Wind Connection project would do,
18 you then bring that cost down.

19 So you have to factor in all of these costs.
20 I know that you are doing that. I would love to talk
21 more, but I want to respect your request to move along
22 quickly.

23 PRESIDENT SOLOMON: Thank you very much,
24 Mr. Mitchell. I only have one question. Has your
25 company and/or others who you mentioned, including PJM,

1 but I'm thinking mostly of Atlantic City Electric and
2 the other EDCs, taken a look at the impact that the

3 offshore wind and transmission lines would have on
4 distribution and what, if any, cost there would be to
5 the distribution upgrades, you know, building those?

6 MR. MITCHELL: That's one of the advantages
7 of the backbone because we're using DC technology which
8 allows us to go longer distances. And, in fact, last
9 Friday at a town hall meeting in Monmouth County -- we
10 have had four such meetings along the coast in the last
11 few weeks -- one wind developer said that they've been
12 amazed at the cost for the individual wind farm to
13 connect to shore; that, in fact, they may have to use DC
14 technology. And so they're really hoping that we will
15 move forward with our plan so that they can plug their
16 wind farm into the backbone, which, in turn, to answer
17 your question, allows us to go deeper inland to where
18 the grid is stronger.

19 So the kinds of upgrades that you might
20 experience along the coast where the grid is weaker will
21 be considerably less.

22 PRESIDENT SOLOMON: Thank you.

23 MR. MITCHELL: Thank you.

24 Elvin Montero.

25 Good afternoon.

□

45

1 MR. MONTERO: Good afternoon.

2 Elvin Montero, M-o-n-t-e-r-o, representing
3 the Chemistry Council of New Jersey.

4 Thank you, President Solomon, other Board
5 Commissioners for this opportunity to comment on the
6 Energy Master Plan. We'll be submitting more detailed
7 comments at a later date.

8 The Council applauds Governor Christie and
9 this plan which puts forward realistic goals that do not
10 cater to any one general group or energy generation
11 solution. We're also glad that the plan promotes a
12 diversified energy portfolio that will be sensitive to
13 the electricity rates consumers will ultimately pay and
14 directs the State to consider all energy generation
15 solutions, such as nuclear and co-generation to help
16 bring down the energy costs while meeting the state's
17 environmental goals.

18 We are encouraged by the administration's
19 recognition for the need for new baseload power plants
20 to update the State's ageing generation supply.

21 Speaking of capacity, while not a popular
22 decision, the council is one of the few trade
23 associations that supported the long-term capacity
24 agreement pilot program because we too realized that the
25 pilot program was addressing the failure of the PJM

46

1 reliability pricing model to incentivize new electricity
2 generation in the State. We are hopeful that this
3 Energy Master Plan will help to get this project online
4 soon.

5 Our members need access to affordable,
6 reliable, and safe energy to help stimulate economic
7 development and investment within our sector. The
8 industry contributes 27 billion to the State's economy
9 and directly employs more than 55,000 individuals. Our
10 industry also provides jobs indirectly. Economists tell
11 us that for every one chemical industry job in New

12 Jersey a total of five jobs are created within the
13 State.

14 Just this past month a membership survey
15 conducted during the months of June and July of this
16 year revealed for the fourth consecutive year,
17 unanimously, our members ranked the cost of regulatory
18 compliance and energy costs as the top two issues of
19 concern facing their companies in New Jersey.

20 One can understand why, as mentioned
21 earlier, since New Jersey's costs of energy costs rank
22 as the sixth highest in the nation and for our large
23 industrial -- energy industrial pairs energy costs are
24 74 percent higher than the national average.

25 For some, energy intensive products, energy

47

1 for both fuel and power needs and feed stock account for
2 up to 85 percent of total production costs. Because
3 energy is a vital component of the industry's cost
4 structure, higher energy prices can have substantial
5 impact. There's no surprise then that the high cost of
6 energy in New Jersey puts our industry at a competitive
7 disadvantage and has driven thousands of jobs to our
8 neighboring states and across the world. Considering
9 that just ten years ago, the chemistry industry directly
10 employed more than 100,000 people in this state. While
11 I realize New Jersey's high cost of energy is not the
12 only contributing factor leading to this decline, it
13 certainly is a major one.

14 we certainly support our last address to the
15 Energy Master Plan: The safe expansion of the natural
16 gas pipeline system. My members are experiencing a

17 manufacturing renaissance due to the access to cheaper
18 natural gas, making their products competitive in the
19 world markets. We fully support the administration's
20 proposal to expand New Jersey's natural gas pipeline
21 system to help support the industry and greater
22 population as a whole.

23 Our ability to create and retain jobs, both
24 in New Jersey and across the United States depends on a
25 stable supply and a competitive price of natural gas and

48

1 we fully support the safe and environmentally sound
2 development of natural gas resources.

3 Just as important as our electricity needs,
4 natural gas is used as a raw material building block to
5 feed stock to create products that make people's lives
6 healthier, safer and more sustainable. I'm talking
7 about products like baby shampoo, lighter automobile
8 parts, solar panel, clothes, cosmetics, and medicine.

9 Manufacturing companies that utilize natural
10 gas are leading economic recovery throughout the
11 country. I do caution the State, however, as company's
12 announce exciting new investments and expansion and
13 power generators begin a large scale shift to natural
14 gas, New Jersey must be sure not to make imposed market
15 distorting incentives to pursue policies that could
16 threaten the reliability of these supplies by pursuing
17 policies that expand safe access to domestic energy
18 resources and at the same time encourage fuel diversity
19 and efficiency. I believe the State understands that we
20 cannot rely on just one energy generation source to keep

21 our lights on in the State.

22 The council supports alternative energy
23 generation solutions. In fact, our members make many of
24 the products that go into solar panels and wind
25 turbines. But what we don't support is the funding

49

1 models that have afforded certain alternative energy
2 solutions guarantying a high rate of return at the
3 expense of ratepayers.

4 We can't afford this: Alternative energy
5 solutions that cost three to four times more than
6 conventional sources of energy generation. The State
7 needs to fully implement the EMP's guideline -- guiding
8 principles to look at cost-effective alternative energy
9 generation options that demonstrate a net benefit to
10 ratepayers, while protecting the environment.

11 Any funding mechanism must keep the
12 ratepayer in mind and the potential to cost reductions
13 due to the advancement of technologies because they must
14 be taken into consideration so ratepayers receive the
15 benefits of lower costs and investors are not guaranteed
16 a rate for an expended period of time at the expense of
17 ratepayers.

18 Some have said that the EMP does not do
19 enough to push for solar and wind energy generation. We
20 think that the EMP is smart: To examine the existing
21 programs and how it has benefitted the State, not only
22 environmentally but economically as well.

23 Certainly, returns for investment firms
24 advantaging these technologies, guaranteeing them a rate
25 of return close 15 to 20 percent.

1 Energy policy that rely only on one source
2 of generation will drive up New Jersey's already high
3 electricity rates. The balance of those to be put forth
4 in this Draft Energy Master Plan is refreshing and
5 coincides with our industry's advocacy efforts to
6 promote an adverse portfolio to conventional and
7 economically feasible renewable technologies that will
8 help address our supply issues and ultimately bring down
9 electricity rates in the State.

10 We commend the administration for promoting
11 a level playing field for all energy sources and
12 technologies by proposing an Energy Master Plan that
13 does not artificially distort markets that have the
14 ability to function on their own.

15 Supporting investment in large scale
16 renewable projects that do require significant subsidies
17 to remain feasible is a direction the State should be
18 heading and the council whose members have historically
19 paid the disproportionate amounts of these subsidies is
20 glad that the State is finally recognizing the added
21 burden these unnecessary subsidies are placing on
22 ratepayers.

23 The Energy Master Plan addresses energy
24 efficiency and other infrastructure upgrade. I did not
25 mention earlier, we certainly encourage the promotion of

1 energy efficiency in New Jersey. We are an industry
2 that has been regularly engaged in this practice and

August 3-2011 EMP Public Hearing.txt
3 with much success.

4 I must caution the State, however, to be
5 mindful that -- of this in setting aggressive standards
6 until technology can meet the needs of our efficiency
7 goals, the industry is limited to energy efficiency
8 generation currently available and more aggressive
9 measures may lead to further erosion of New Jersey's
10 manufacturing job base.

11 In terms of energy infrastructure, we
12 certainly support upgrading our transmission system. In
13 fact, we are on the record supporting the
14 Susquehanna/Roseland power line project.

15 The State should give consideration to
16 upgrade that will take advantage of technological
17 advances so that we can more efficiently move
18 electricity throughout the State which can have an
19 impact on pricing and in doing so lower our prices.

20 Finally, as you examine New Jersey's policy
21 which adds surcharges to our already high electricity
22 rates, be mindful of large energy users like the members
23 that I represent. They pay a disproportionate amount
24 into various funds, like the societal benefits fund.

25 As you look at the different policies and

52

1 surcharges, try to make them more equitable. We feel
2 that it is only right that the share made by large
3 industrial users be directed into programs that will
4 help these ratepayers implement more energy efficient
5 technologies that will help New Jersey achieve it's
6 lower carbon energy goals.

7 The Draft Energy Master Plan has a potential
Page 44

8 to significantly improve energy utilization throughout
9 the State. It promotes the interest of payers of all
10 sizes, encourages energy diversity, and ensures
11 protecting the environment, and fosters innovation and
12 economic growth. The proactive approach being exhibited
13 by the BPU and demonstrated in this Energy Master Plan
14 is refreshing and welcomed.

15 we look forward to working with you to help
16 share, shape, and implement policies that will reduce
17 our energy rates while protecting the environment.

18 Thank you.

19 PRESIDENT SOLOMON: Thank you, Mr. Montero.

20 MR. MONTERO: Thank you.

21 PRESIDENT SOLOMON: Sara Bluhm.

22 Good afternoon.

23 MS. BLUHM: Good afternoon, Sara Bluhm,
24 B-l-u-h-m, and I'm with the New Jersey Business Industry
25 Association, and you hear from me quite often.

53

1 PRESIDENT SOLOMON: I've never seen you
2 before in my life.

3 MS. BLUHM: NJBIA represents over 22,000
4 companies in state and we were very glad to see that the
5 number one goal in this was reducing energy costs for
6 consumers. For many years now, we've been coming before
7 you and looking at ways that we can reduce our energy
8 costs.

9 NJBIA has been around over a hundred years
10 and we started out as a manufacturers association and
11 over the hundred years we have changed as has industry

12 in New Jersey. But one thing that has remained has been
13 energy costs have remained as part of the cost of doing
14 business here in the State.

15 And I think today you've heard from some of
16 my other colleagues, business associations, at what the
17 cost of energy does for companies that want to be in our
18 State and how we need reliable, affordable power. So we
19 were very glad to see within the plan ways that we're
20 going to be looking at, what does power cost, what are
21 the different programs we're going to have in place, and
22 how are we going to try to reduce some of these costs
23 overall.

24 As you've seen from some of the analysis
25 done from Rutgers, 27 percent of the electric bills for

54

1 commercial/industrial is government imposed policy. We
2 have been working at lowering some of those charges and
3 we were very happy to see the retail margin charge
4 disappear. TEFA hopefully will be gone by 2013. And
5 we've seen some other reduced charges there as well,
6 RGGI by the end of the year we expect as well.

7 So if we can bring that 27 percent down,
8 then we can help free up capital in other parts of the
9 business. And whether it is investing in energy
10 efficiency projects or renewables or just paying bills,
11 period, we are looking at ways that we can continue to
12 reduce those costs, whether it's through the societal
13 benefits charges or other things.

14 We were excited to see within the plan that
15 we are going to have increased supply of natural gas,
16 looking at biomass and other things. Our companies are

17 looking at cutting edge technology in ways that they can
18 work with a variety source of fuels and technologies to
19 meet the increasing energy needs within our state.

20 But one of the other very important things
21 for us was having the net economics benefits tests. And
22 this has been coming up in many different policies and
23 seeing that within the plan so that we can figure out
24 where we're getting the best bang for our buck, what
25 should we invest in, and what should we be putting on

55

1 the backs of ratepayers.

2 we look forward to working with you on many
3 of these different policies, but we are very happy to
4 support the goals of the Energy Master Plan as they
5 provide a realistic path for our future and lower costs
6 to consumers.

7 Thank you.

8 PRESIDENT SOLOMON: Thank you, Ms. Bluhm.

9 Thank you.

10 Joanne Pannone.

11 Joanne Pannone.

12 You're not Joanne Pannone.

13 Your name, sir.

14 MR. FLUCK: George Fluck.

15 PRESIDENT SOLOMON: George Fluck.

16 Are you signed up, sir?

17 MR. FLUCK: Yeah, I'm signed up and I have a
18 statement.

19 PRESIDENT SOLOMON: You're in here
20 somewhere. I want to make sure I don't call you later.

21 MR. FLUCK: George Fluck, F-l-u-c-k.

22 PRESIDENT SOLOMON: You are speaking for

23 Ms. Pannone.

24 MR. FLUCK: I'm going to read her statement.

25 She writes: Joanne Pannone is from

56

1 Robbinsville, New Jersey.

2 Governor Christie has hurt me financially as
3 he took BPU money that was used for grants, people
4 installing solar panels and geothermal heating and
5 air-conditioning systems. I am one of those people who
6 had started my geothermal project and then could not get
7 the funding. Now I'm looking at solar panels with the
8 cost of outreach without a government grant.

9 My home which was heated by oil is now
10 environmentally better and cleaner for New Jersey only
11 if I can get off the dirty grid.

12 Neptune, New Jersey, has a perfect example
13 of a green school which should serve as a model for all
14 of us: solar power, geothermal, high VAC, and even a
15 green sewerage disposal system.

16 While I am committed to greener living, I
17 believe that we should be responsible for taking part in
18 cleaning up our environment to protect our health and
19 the health of future generations. We should reduce the
20 pollution that threatens our future.

21 The Star-Ledger magazine has an article this
22 month about childhood cancers. States that each year a
23 child with cancer diagnosis is delivered to more than
24 10,000 families across the country with 250 of them in
25 New Jersey. From miners who suffer from black lung and

1 other work-related ailments to minors -- to the minors,
2 our children who contract asthma and cancer are genetic
3 malfunctions from our polluted environment.

4 I have been to other hearings where people
5 testified about how the acid rain has ruined fishing
6 streams and athletes lungs born from the air. The
7 weather channel now reports bad air days and warns
8 people to avoid being outside when the pollution caused
9 by the use of fossil fuels. The earth was not polluted
10 until man started burning coal, gas, and oil.

11 we cannot in good conscious ruin the next
12 generation's future by not starting now by eliminating
13 coal-burning generating plants. We must develop wind,
14 solar, and other renewable sources of power which will
15 eliminate these pollutions and related health problems
16 and create a fast growing global market for energy
17 efficient equipment and renewable fuels. Reduce the
18 pollution that threatens our future now. Tomorrow is
19 too late.

20 Thank you.

21 PRESIDENT SOLOMON: Thank you, sir.

22 Fred DeSanti.

23 Fred, would you mind waiting for one second,
24 I see the assemblyman just walked in.

25 There's a lot of people here that want to

1 heckle you so I thought I'd bring you up first before
2 they do.

How are you?

ASSEMBLYMAN CHIVUKULA: I'm doing well.
Thank you. And I just wanted to -- I didn't know I
would get called so fast.

PRESIDENT SOLOMON: I appreciate all the
times you called me first at your committee hearings so
here you are.

ASSEMBLYMAN CHIVUKULA: Thank you very much,
President Solomon and Commissioner Jeanne Fox and
Commissioner Asselta and Joe Fiordaliso and I see we
have Rhea.

I just want to thank you for this
opportunity to testify on the Energy Master Plan 2011.

I commend the Board of Public Utilities --

PRESIDENT SOLOMON: Make sure you speak
slowly so the court reporter can get everything down.
You didn't have a chance to hear my cautionary
instructions. But if she loses it, we lose it too so
take your time.

ASSEMBLYMAN CHIVUKULA: Too fast, eh?

PRESIDENT SOLOMON: A little bit.

ASSEMBLYMAN CHIVUKULA: I started thanking
President Solomon.

59

PRESIDENT SOLOMON: You can say that again,
slower.

ASSEMBLYMAN CHIVUKULA: I commend the Board
of Public Utilities for reviewing the Energy Master Plan
2008 and developing the plan for New Jersey to address
the energy needs for the next ten years and beyond.

Let me ask you why do you want to backtrack

8 from progress? Why are we turning away from success?

9 New Jersey is poised to surpass many of the
10 goals for clean energy in the original Energy Master
11 Plan of 2008. We are powering a robust clean energy
12 economy and reducing global warming pollution. Our
13 growth in solar is a shining example of the success of
14 the Energy Master Plan.

15 As a result of accuracy of targets, we have
16 crossed that threshold of 10,000 solar installations.
17 By developing a plan for 3000 megawatts of offshore wind
18 by 2020, we will have the capacity to power more than
19 1 million homes to clean energy.

20 So societal benefit charges have been
21 instrumental in crediting a very successful clean energy
22 program and energy efficiency programs. We must convert
23 that -- converting that into a loan program does
24 injustice to the ratepayers. By incentivizing for
25 energy efficiency, we have converted significant savings

60

1 to residential and industrial ratepayers.

2 As reported by a recent study by the
3 Brooklyn Institute, more than 26,114 clean jobs were
4 generated between 2003 and 2010 at an annual growth of
5 4.6 percent. The current number of clean jobs in New
6 Jersey is 94,241 statewide which is 2.4 percent of the
7 total employment field.

8 As I note the key differences between 2008
9 Energy Master Plan and 2011 EMP, I am concerned about
10 lowering the renewable energy portfolio standard. The
11 RPS from 2008 EMP goal of 30 percent total generation by

12 2020 to 22.5 percent of total generation by 2021. We
13 have to be aggressive in setting our goals high and
14 strive towards them rather than giving up and lowering
15 the goals. Energy issues is not just cost dependent, it
16 also should take into account our national security.

17 We should restrain our thirst for foreign
18 oil and invest in alternate sources which are less
19 dependent on foreign sources. I think that we must have
20 an adequate supply of energy sources considering each
21 source has an important role, but the portfolio should
22 be a mix of renewables and baseload generation.

23 We cannot product knowledge that solar
24 industry in New Jersey has taken off and has created
25 hundreds of clean energy jobs. The Solar Energy

61

1 Advancement and Fair Computation Act required that the
2 BPU would set up solar alternative compliance payments
3 beyond 2016, but the Board's inaction in this matter has
4 created tremendous uncertainty in the solar marketplace.

5 The EMP only recommends solar programs such
6 as solar alternative compliance payments and solar
7 renewable energy certificate to ensure
8 cost-effectiveness and de-emphasizes the power derived
9 from renewable energy sources. Therefore, the
10 administration's EMP does not show commitment to
11 renewable energy.

12 The importance of solar generation capacity
13 in the New Jersey cannot be understated. It has played
14 and continues to play an increasingly important role in
15 New Jersey's power market. As said, reliable, clean
16 resources committed within peak hours; hence, it should

17 be highly valued.

18 Reducing the SACP with the lower one-time
19 step down in 2017 and maintaining, if not increasing,
20 and certainly not decreasing. And the current solar
21 renewable portfolio standard would help maintain the
22 goal for projectory of an important new industry that
23 has brought capital and jobs to the State and help avoid
24 the boom-and-bust cycle that would derail the tremendous
25 achievements made by the State to date.

62

1 As noted in the EMP, energy efficiency and
2 conservation are quite important to the energy policy.
3 we should always take advantage of smart grid
4 technologies to achieve energy efficiency which would
5 also develop the need for infrastructure needed for
6 electric vehicles, in addition to natural gas vehicles.

7 As part of the consumer education, we need
8 to address dynamic pricing in an attempt to share off
9 the peak load requirements.

10 The Energy Master Plan is working and has
11 helped us become a leader in clean energy and directs us
12 toward a responsible energy future.

13 We must reduce our dependence on fossil
14 fuels. why do we want to backtrack progress? why do we
15 want to turn away from success?

16 By pulling back from our investment from
17 clean energy economy, we are sending the wrong signal to
18 the financial marketplace, including those across the
19 boarder. Business needs certainty and changing the
20 course destabilizes business investments. We must stay

21 the course.

22 In conclusion, we should go forward in our
23 approach toward a sustainable energy policy that
24 combines clean energy sources, along with less polluting
25 baseload and new generation sources to meet New Jersey's

63

1 energy demand.

2 Dismantling an energy infrastructure set
3 forth in the Energy Master Plan and vast landmark
4 initiatives like regional greenhouse initiative, the
5 Global Warming Response Act, and measures like offshore
6 wind and economic development and solar renewable energy
7 certificates can lead to a flawed policy. It is
8 tantamount to the reckless endangerment of a responsible
9 energy future of our State, which, today, we are a
10 national leader.

11 Thank you very much, President Solomon and
12 the Commissioners.

13 PRESIDENT SOLOMON: Thank you.

14 Just a couple, when I read this and you read
15 anything over and over and over, sometimes it does not
16 become clear what inferences may be drawn.

17 Is there anything in the master plan at all
18 that reduces the solar targets?

19 ASSEMBLYMAN CHIVUKULA: It does not reduce
20 the targets, but what it does, one of the requirements
21 as we pass the legislation as part of the statute, we
22 define the SACP payments which is a cap.

23 PRESIDENT SOLOMON: Speak slowly so she can
24 get it all.

25 It's really a very simple question. I got

1 the impression of what you're saying that we reduce the
2 solar targets. I don't remember saying to that effect.

3 ASSEMBLYMAN CHIVUKULA: what happens is the
4 SACP is a cap.

5 PRESIDENT SOLOMON: I have questions about
6 that. Let me get to that again.

7 ASSEMBLYMAN CHIVUKULA: Okay. So that
8 finished that part.

9 PRESIDENT SOLOMON: I might ask you about
10 the SACP and then go into that as much as you want.

11 Is there any relationship as of today
12 between the SACP and even the schedule proposed in the
13 master plan, which is there, it needs to be decided by
14 the Board, and what current spot market and even
15 long-term contracts are for SREC prices?

16 Because I did check yesterday and I think
17 that the -- well, the prices are substantially lower
18 than the SACP which is a ceiling.

19 ASSEMBLYMAN CHIVUKULA: You made my point
20 basically that the SACP is meant to be a cap not to
21 drive the highest price. When statements are made
22 saying that the cost of our highest SACP SREC prices are
23 high and we need to do something about it, those types
24 of statements sends mixed signals to the financial
25 marketplace; and, thereby, even though it has not

1 reduced the targets for the SRECs in terms of gigawatt
2 hours, what we need to produce, the financial markets

3 they can be wacky. They react to a lot of things. And
4 so especially when it comes from the administration and
5 the Governor himself says, okay, I want to come out of
6 RGGI, I want to do this, I want all of these expenses --
7 those types of statements, even though they don't mean
8 harm, they do a lot more damage.

9 PRESIDENT SOLOMON: I was just curious
10 because I know that the current spot prices are hundreds
11 of dollars less than the SACP that exists and the SACP
12 that is suggested in the master plan. So I understand
13 what you're saying. I talk to the markets every day.

14 My impression, frankly, was that the
15 uncertainty in the markets is being driven by a fear
16 that the bottom, not the top, would drop out of the SREC
17 market because we're meeting our targets, we're getting
18 these, and it has absolutely zero, nothing at all, and
19 I'm sure there are financial people that will be
20 testifying, and please correct me if I'm wrong, nothing
21 to do currently with either the SACP or the proposal in
22 the master plan.

23 Now that's a different issue that they're
24 concerned about. You may want to deal with in the
25 legislature, but I'll tell you what I said to everybody

66

1 here so you're not caught unaware. The 22.5 is the
2 number that was set by the legislature and I may be
3 wrong --

4 ASSEMBLYMAN CHIVUKULA: That's correct.

5 PRESIDENT SOLOMON: I'm not wrong about
6 that. But I may be wrong that policy should be set by
7 the people elected by the public to set policy, and at

8 the risk of offending the other commissioners and staff,
9 bureaucrats should carry out that policy.

10 And so I have always been and publicly been
11 reluctant to set policy that really is in the hands of
12 people like you. There have been years since the Solar
13 Advancement Act and the 22.5 percent standard for all
14 renewables was set as a floor, not a ceiling. We may
15 bypass it. And the legislature and the prior Governor
16 did nothing to change it.

17 But I suggest, just a suggestion, that if
18 the legislature thinks that what we said in the master
19 plan which is what the legislature said in statute is
20 too low as a floor, they should change it. And believe
21 me, we'll act on it.

22 I think, Assemblyman, you'd agree, I'm
23 pretty darn good at pushing policy that the legislature
24 gives us. Just look at LCAPP, even when the whole world
25 is out to have my head.

67

1 ASSEMBLYMAN CHIVUKULA: I think it is not
2 you and us or I. It's us working together. What is in
3 the best interests of the State of New Jersey. What can
4 we do. How can we advance policy.

5 So what's happened is the policy from 2008,
6 which is not even three years, August of 2008 policy,
7 it's only three years, we haven't given that an
8 opportunity to really work and reinventing.

9 And, yes, I do understand the Energy Master
10 Plan. It's just a plan. It has to be substantiated in
11 the legislation which we are in the process of doing.

12 But really what I urge you is that we have
13 to work together and together we can send the right
14 signals that we are working together to set the right
15 policy for the State of New Jersey. I think actually by
16 lowering it in the sense that we could have said that
17 this is the statutory environment.

18 PRESIDENT SOLOMON: We did say it's the
19 statutory and, frankly, we did say that we didn't think
20 the 30 percent as a floor was attainable but believe me
21 if there is a rationale, not that the legislature needs
22 one, but if there is a rationale for 30 percent and a
23 methodology to get there, then the public, everybody
24 would support the 30 percent, whether there's a
25 rationale or not, if the legislature passes it and

68

1 Governor signs it or does sign it, we'll work to carry
2 it out. We'll do what we can.

3 But I was just pointing out and my whole
4 point was, as we said in the master plan, the statutory
5 target is a floor -- we may hit 30, we may hit 50 -- is
6 the 22 and a half, and I am reluctant because I have too
7 much respect for the legislative branch I serve with the
8 assembly to say we can usurp their authority and set
9 policy. We didn't get elected to do any of that.

10 Now let's talk about that. We'll meet and
11 discuss it. But I encourage the legislature and all
12 elected officials to do what they're elected to do and
13 we'll do what we were appointed to do which is to carry
14 out the policy.

15 ASSEMBLYMAN CHIVUKULA: I appreciate your
16 candor and working together. I think --

17 PRESIDENT SOLOMON: I have one last
18 question.

19 And we have no intention of lowering -- and
20 I don't think we did lower anything dealing with solar
21 targets. Where in the master plan does it talk about
22 lowering or eliminating subsidies?

23 You're not the only one who said it to us.
24 I heard about it.

25 ASSEMBLYMAN CHIVUKULA: In the language you

69

1 say a lot of things by not saying it. But that's the
2 beauty of it. I mastered that because of my legislative
3 background.

4 PRESIDENT SOLOMON: I thought the master
5 plan said a lot about taking the money that we gather
6 and using it effectively to get more energy efficiency,
7 more renewables, more, more, more, not less, less, less.

8 And I can tell you and I'm not suggesting we
9 can do it now, it's a hundred and some-odd pages, I
10 think I've read it a hundred times. If you go through
11 it and you find places where you think we're suggesting
12 lowering those subsidies, I'd be happy to look at it and
13 work with our commissioners to try and fix it.

14 My argument would be -- and I could be wrong
15 and I would be honored to be correct -- that we are
16 actually talking about putting more money where our
17 mouth is; in other words, getting dollars to effectively
18 result in more renewables, more clean energy, more
19 energy efficiency, more demand response, and in a way
20 that is more attractive to business, industry,

August 3-2011 EMP Public Hearing.txt
21 government, and the public. That is what I'm
22 representing to everybody and what is on the record. I
23 think that is what the master plan says.

24 Any suggestions or corrections you or any
25 other legislator has, please get it to me and we will

70

1 work on it collectively.

2 ASSEMBLYMAN CHIVUKULA: Yes, definitely. I
3 think that is great that you are open. You are
4 reassuring the people who are here listening and reading
5 that you are not -- your intention is not to lower but
6 to go forward.

7 PRESIDENT SOLOMON: Not only is it not our
8 intention, I don't think it says it anywhere in the plan
9 and it certainly doesn't usurp legislative authority
10 which, Assemblyman, I have too much respect to you and
11 the body to ever do that, as much as you may want me to.

12 ASSEMBLYMAN CHIVUKULA: Thank you so much.
13 Any other questions?

14 PRESIDENT SOLOMON: I'm not letting them ask
15 questions.

16 ASSEMBLYMAN CHIVUKULA: Thank you for your
17 time.

18 PRESIDENT SOLOMON: Thank you.
19 Fred DeSanti.

20 MR. DeSANTI: Thank you, President Solomon.
21 I appreciate deferring to the Assemblyman.
22 Good call.

23 I would just spend a second to introduce
24 Jeff Milanaik. Jeff is the President of Heller
25 Industrial Parks. He's going to be speaking for the

1 first time on behalf of the New Jersey Solar Energy
2 Coalition. This is the formal statement.

3 And thank you very much for your time.

4 Jeff.

5 PRESIDENT SOLOMON: Could you spell your
6 last name?

7 MR. MILANAİK: Jeff Milanaik,
8 M-i-l-a-n-a-i-k.

9 In an effort to consolidate the statements
10 that's why we agreed to get together. I do have a card
11 in there somewhere so if you would like to pull that.

12 There you go. Thank you.

13 President Solomon, Commissioners, and
14 members of the New Jersey Energy Master Plan review
15 commission, my name is Jeff Milanaik, President of
16 Heller Industrial Parks of Edison, New Jersey, today
17 representing for the first time in public forum the New
18 Jersey Solar Energy Coalition. Our coalition, cleverly
19 comprised of 17 diverse member companies, is constituted
20 of solar integrators or developers, solar financial
21 services firms, solar manufacturing firms, solar legal
22 and accounting services firms, solar engineering
23 services firms, and real estate investment and
24 development corporations, such as mine, that have come
25 together to support the goals of sustainable solar

1 energy development in New Jersey in a way that is
2 consistent in most areas which what has been articulated

August 3-2011 EMP Public Hearing.txt
3 in your draft plan.

4 The overarching goal of our coalition is to
5 ensure that the public policy framework that supports
6 New Jersey's solar industry will sustainably carry us
7 through our ultimate goal of achieving the level of
8 solar capacity envisioned under the currently
9 statutorily mandated renewable portfolio standard
10 through 2026.

11 we believe that goal of creating
12 5000 megawatts of solar capacity within the next 15
13 years represents a most significant dedication to solar
14 energy, and one that can be attained if, and only if,
15 the ratepayers of New Jersey can be provided with the
16 values from their investment that they deserve,
17 developed at a growth rate that they can afford.

18 New Jersey's continuing leadership and
19 success in the deployment in solar energy can only be
20 achieved through thoughtful policy leadership that
21 balances the costs and benefits of solar energy. We
22 need to recognize that our desire to create renewable
23 energy resources obtain the benefits of distributed
24 generation, economic development, job creation, and
25 lower energy costs for New Jersey consumers of this

□

73

1 technology and, of course, the intended reductions in
2 carbon can only be achieved and sustained if the rate of
3 development of these resources can be matched or public
4 support structure and does not outrun our ability to
5 finance it.

6 We are, therefore, in agreement with the
7 Draft Energy Master Plan's findings and recommendations

8 in the following areas:

9 we believe that the current statutorily
10 defined renewable portfolio standard is achievable. It
11 is very aggressive but also realistic in terms of its
12 free market approach in managing the development of the
13 marketplace over an extended period.

14 we also believe that the free market system
15 as currently constituted should stand without
16 modification or alteration, except as we will narrowly
17 suggest for 2013 in order that the financial markets
18 become more confident in the permanent nature of this
19 public policy and that is beyond the reach of any
20 attempt to manipulate either the short- or long-term
21 markets for solar renewable energy credits in New
22 Jersey.

23 Since 2007 the marketplace has enjoyed the
24 specific incentives needed to spur the development of
25 solar energy in New Jersey that is now taking place.

□

74

1 Our industry has now ensured supply and
2 demand is coming into balance in accord with the RPS
3 market design. And while we would not say that we
4 welcome the resulting lower market prices, we recognize
5 that they are a necessary element to a sustainable
6 long-term future for our industry.

7 Further, we agree with the fundamental
8 principles expressed within the Draft Energy Master Plan
9 document that solar energy generation must produce more
10 for New Jersey ratepayers than just the single attribute
11 of carbon reduction. Residences, commercial and

12 industrial buildings across the State should also reap
13 the financial benefits that solar energy should deliver,
14 discounted and predictable energy prices, either through
15 self-use of the energy created or through power purchase
16 agreements that reflect below market cost structures.
17 We agree that these benefits are essential in balancing
18 in helping New Jersey's economy in a sustainable way.

19 To that end, we also agree that grid-based
20 solar projects should be limited to either landfill or
21 brownfield projects in accordance the policies
22 articulated in the Draft Energy Master Plan. Grid-based
23 projects, particularly those in excess of 10 megawatt
24 have the ability to imperil the solar energy renewable
25 credit marketplace and potentially derail far higher

75

1 quality projects that create the additional congestion
2 relieving benefits of distributed generation, as well as
3 aforementioned lower cost energy opportunity for New
4 Jersey residents and businesses.

5 We believe that 82529 now awaiting
6 legislative concurrence with the Governor's
7 recommendations represents an important opportunity to
8 provide the Board of Public Utilities in conjunction
9 with the Department of Environmental Protection with the
10 oversight mechanisms necessary to protect the long-term
11 sustainability interests of solar policy in the State of
12 New Jersey. Simply stated, without this oversight
13 regulation, we are very concerned that the future of the
14 solar renewable energy credit marketplace is in
15 jeopardy.

16 As you know, the senate has already passed a
Page 64

17 piece of legislation that will create demand injection
18 in 2013 of several hundred megawatts from the back end
19 of the renewable portfolio standard to absorb some of
20 the projected overbill that might otherwise eviscerate
21 the market for a second consecutive year in 2013.

22 while we do not endorse any intervention
23 artificially propping the prices, we do think that two
24 consecutive years of surplus SRECs in 2012 and 2013
25 might result in business continuity issues on an

76

1 industry-wide basis that deserve appropriate
2 consideration. We hope that the Board will actively
3 consider these issues to properly balance the long-term
4 goals we all hope to achieve.

5 The master plan also proposes to reduce the
6 solar alternative compliance payment schedule beginning
7 in 2013 first by 20 percent, and then by 2.54 percent
8 per year to continue the current annual detriment.
9 while we do not understand this logic based upon your
10 correct assumption that the capital cost of solar
11 installations has come down considerably since 2007 when
12 the SACP was first structured, we would, however, offer
13 the following for your consideration.

14 First, as we apposited, the spot market in
15 2012 and 2013 will be sharply reduced by current levels
16 by market forces that we are now seeing taking effect.

17 Secondly, it now appears very likely that
18 the 30 percent investment tax credit, now cash, will
19 revert back to a tax credit in January of 2012 resulting
20 from the current federal mandate to cut expenses and

21 programs.

22 This change to the Federal 1603 program will
23 also very likely have a considerable dampening effect on
24 project financials going forward. Of even greater
25 concern, the Federal 1603 ITC is currently scheduled to

77

1 completely expire in 2017. The first year of the
2 extended SACP schedule and may not be extended even as a
3 credit at the current level. We recommend, therefore,
4 that these elements be appropriately factored together
5 with a proposed 20 percent reduction in the compliance
6 payment schedule.

7 We would ask that you consider these
8 elements in your deliberation, along with the fact that
9 equity component of financing is becoming somewhat more
10 expensive as lower prices increase investor perceptions
11 of risk.

12 We believe that while it is true that the
13 capital costs of these projects is significantly lower
14 than they were when the original schedule was advised,
15 competing factors that very likely might result in a
16 severely depressed marketplace should be appropriately
17 valued as you consider the development of the
18 statutorily mandated schedule through 2026.

19 We would hasten to add that the confidence
20 of the marketplace would be bolstered immediately by
21 early action in developing the remaining compliance
22 payment schedule.

23 Utility loan and tenure auction programs
24 have also become important tools that have helped settle
25 the market and provided opportunities for projects

1 requiring greater financial certainty. We think the
2 Board is on the right track with that initiative and
3 hope to see these programs continue as appropriate to
4 market needs in the future.

5 We will also provide in writing a
6 supplemental filing containing additional economic
7 analysis relating to the cost of solar generation in
8 order to provide additional sensitivity to your analysis
9 as it relates to solar energy values in terms of
10 distributed generation resource, replacement for fossil
11 based peak generation, and mid-merit load generation.
12 This information is intended to offer a somewhat wide
13 range of assumption that can be appropriately factored
14 into the overall economic evaluation.

15 In the interest of your time we are limiting
16 our comments today to those related to solar energy and
17 the draft energy master plan's impact on our industry
18 going forward.

19 We would reiterate our support for the
20 overarching goals developed within the document and our
21 general support for all of the other items discussed
22 throughout the document. We believe that careful
23 review, thoughtful approach, and appropriate concern for
24 the balancing of all interests in advancing New Jersey's
25 energy policy goals have given us all an opportunity to

1 reflect upon the long-term interest of our industry.
2 And perhaps most importantly job creation and job

3 August 3-2011 EMP Public Hearing.txt
retention at this critical period.

4 On behalf of the New Jersey Solar Energy
5 Coalition, we very much appreciate the time and
6 consideration of our comments and look forward to
7 working with you in the future toward achieving these
8 goals. Thank you much for your time and attention.

9 PRESIDENT SOLOMON: Thank you, Mr. Milanaik.

10 MR. MILANAİK: Thank you.

11 PRESIDENT SOLOMON: Evelyn Liebman.

12 Good afternoon.

13 MS. LIEBMAN: Good afternoon, President
14 Solomon and members of the Board. My name is Evelyn
15 Liebman and I'm the Associate State Director for AARP.

16 On behalf of AARP's 1.3 million members, we
17 appreciate the opportunity to testify today on New
18 Jersey's 2011 Draft Energy Master Plan.

19 We will be submitting more detailed written
20 comments. And so in the interests of time I'll limit my
21 comments today of several areas of particular concern to
22 consumers.

23 AARP is the only national advocacy
24 organization working at both the federal level and in
25 the states to advance energy affordability and consumer

□

80

1 protection from unfair utility policies and rate
2 increases.

3 We strongly believe that all consumers must
4 be able to rely on essential utility services that are
5 available and affordable to all houses. As you know,
6 rising home energy prices are squeezing household
7 budgets, especially for those with low and fixed

8 incomes.

9 As you've heard many times today, New
10 Jersey's energy prices are among the highest in the
11 nation. Today's escalating energy prices are adding to
12 growing economic hardships faced by many older Americans
13 who are especially vulnerable as energy prices continue
14 rising in part because they already spend a far greater
15 proportion of their income on home energy costs than
16 younger households.

17 Research shows that when energy prices
18 increase, households headed by older adults often keep
19 their homes at unsafe temperatures or skim on paying for
20 other necessities. We, therefore, wholeheartedly agree
21 with the first of the Draft Energy Master Plan's
22 overarching goals which is to drive down the cost of
23 energy for all consumers.

24 We at AARP are proud to have played a key
25 role in establishing New Jersey's universal service

81

1 program, or USF, a model affordability program that
2 serves more than 150,000 New Jersey electric and gas
3 utility customers. New Jersey's USF program and policy
4 adheres to the proposition that affordability means all
5 consumers should be able to purchase a level of service
6 that meets their daily needs at an affordable price such
7 that no one should have to forego other basics,
8 including medicine and food.

9 We continue to work with policymakers
10 throughout participation of BPU's universal service fund
11 working group and are in strong support of the potential

12 energy affordability programs for New Jersey's low
13 income families.

14 The need for New Jersey's USF program and
15 LIHEAP is particularly evidenced during difficult
16 economic times. Indeed throughout the U.S. the effects
17 of historically high energy prices and increase in price
18 volatility are taking a toll on millions of utility
19 customers driving up the number of past due home energy
20 bills of the amounts owed and placing many households at
21 risk of disconnection. Thus, we urge policymakers to
22 continue to support and improve New Jersey's USF program
23 and to maintain its funding through the societal
24 benefits charge.

25 In terms of smart meters the Draft EMP

82

1 proposes to expand implementation of smart meters and
2 gradually expose customers with lower energy demands who
3 wish to take advantage of dynamic pricing, to encourage
4 wiser energy use, and reduce retail prices for all
5 residents. While there's a widespread consensus that
6 the distribution and transmission systems for vital
7 electricity services needs to be modernized and
8 upgraded, the so-called smart grid benefits must be
9 carefully proven out in review of the merits of any
10 smart grid proposal.

11 In particular, smart meter adoption is not
12 risk free. Stranded costs, those related to premature
13 abandonment of the existing metering systems, unrealized
14 consumer benefits, and the potential for pricing
15 proposals that may be harmful to some consumers, if not
16 all customers, as well as the potential for increased

17 disconnections if consumer protections are not
18 maintained or enhanced are a few of the problems that
19 must be addressed.

20 In our view these concerns must be
21 considered in the evaluation of the smart grid policies
22 and smart metering initiatives in particular. As with
23 the Draft EMP emphasis on strong cost benefit analysis
24 and other areas, we recommend the administration
25 recognize and incorporate the privacy of robust benefit

83

1 cost analysis from the consumer perspective with respect
2 to smart meter policies and promote key consumer
3 protections to accompanying smart metering proposals.

4 We recommend specifically that smart meter
5 proposals must be cost-effective and utilities must
6 share the risks associated with these new technologies
7 and the benefits used to justify the investments.

8 Time of use or dynamic pricing must not be
9 mandatory. Consumers should be allowed to opt in to
10 additional dynamic pricing options that are, in fact,
11 found to be cost beneficial and for which consumers will
12 realize benefit.

13 We ask that you, as regulators, assess
14 alternatives to smart meters to reach the same load
15 management goals, particularly rebate programs, direct
16 load control programs, energy efficiency, and
17 weatherization programs.

18 Utilities themselves should be required to
19 evaluate the least cost means of achieving a reasonable
20 level of peak reduction and usage reduction overall in

21 August 3-2011 EMP Public Hearing.txt
any smart metering proposal.

22 Smart meter investment should not in any way
23 result in reduced levels of consumer protection,
24 especially related to the implementation of remote
25 disconnection and traditional billing and dispute rights

84

1 must be retained.

2 An important area as we are learning is
3 privacy and cyber security concerns must be addressed
4 prior to any smart meter rollout. Utilities and other
5 policymakers should include comprehensive consumer
6 education and bill protection programs and any
7 evaluation of implementation of the smart meter
8 proposals.

9 And, finally, investments in smart grid need
10 to be verifiable, they need to be transparent, and the
11 utilities need to be held accountable for the cost they
12 want customers to pay and the benefits they promise to
13 deliver. All costs should be reasonable and all costs
14 should be prudent.

15 Finally, the draft EMP states that the
16 benefits associated with better transparency and
17 knowledge of energy use points to the need to work with
18 multifamily residential building owners and tenants on
19 submetering. Here, too, there are important consumer
20 protections and rate impacts that policymakers must
21 address. The essence of submetering is simply a shift
22 from the owner to the tenant to the cost of the
23 electricity. From the policy perspective, however,
24 giving tenants the electric bills when they neither own
25 nor control the fundamental factors driving consumption

1 is, in fact, questionable. It diminishes incentives for
2 owners to replace their inefficient appliances,
3 fixtures, and controls, or to improve thermal efficiency
4 of the structure itself, for example, without any
5 insulation. And we have not found any reliable evidence
6 that shifting bills to tenants results in lower usage,
7 even though submetering is often claimed to be justified
8 on this basis.

9 So these are just several of the consumer
10 protection areas that AARP is concerned with.

11 we'd like to thank you very much for
12 considering our comments and we look forward to working
13 with all parties in the development of the final plan.

14 PRESIDENT SOLOMON: Thank you.

15 Suzanne Patnaude.

16 Suzanne.

17 I'm sorry.

18 MS. PATNAUDE: President Solomon,
19 Commissioner Fox, Commissioner Fiordaliso, and
20 Commissioner Asselta, as well as Mr. Sheen, Mr. Jackson,
21 and Ms. Brekke, thank you for the opportunity to comment
22 today on the proposed 2011 New Jersey Energy Master
23 Plan.

24 My name is Suzanne Patnaude and I am the
25 Director of Government Relations for Solyndra, LLC.

1 Solyndra is an American manufacturer of
2 cylindrical solar panels. Solyndra's unique solar

August 3-2011 EMP Public Hearing.txt
3 panels were invented in America, designed in America,
4 and are manufactured in American, using American
5 minerals and components and an American workforce.

6 This is an ongoing challenge considering the
7 support our Chinese competitors are given by their
8 government. Just yesterday I read that they now
9 developed a solar system for yaks in China in order to
10 stimulate solar business. I don't know what yaks are
11 going to do with the power, but they're generating.

12 Solyndra has met this challenge by reducing
13 its cost by 30 percent in 2010 and anticipates a cost
14 reduction of 30 percent again this year, as well as
15 ramping up our sales efforts in the United States.
16 Solyndra employs over a thousand people in the United
17 States.

18 In 2010 Solyndra purchased equipment
19 manufactured in 16 states, including 5 million in New
20 Jersey alone, as well as 150 million in materials from
21 12 additional states.

22 Solyndra has contributed \$2 million in
23 construction work in New Jersey last year.

24 I would like to address the following points
25 in the 2011 Draft Energy Master Plan.

87

1 Setting the alternative compliance payment
2 for 2017 to 2026; utilizing a mix of energy sources,
3 including installation of solar on commercial buildings
4 and government buildings, brownfields, and landfills; a
5 new nuclear plant; combined cycle and natural gas
6 generation of electricity; and increased use of combined
7 heat and power.

8 I see you rubbing your eyes. This is very
9 short and large print.

10 PRESIDENT SOLOMON: I was in a chlorinated
11 swimming pool this morning.

12 MS. PATNAUDE: As well as using a
13 market-based approach for all energy sources; and
14 setting the floor for renewable energy targets at
15 22.5 percent by 2021.

16 First, the SACP: New Jersey became a leader
17 in renewable energy by having a strong renewable
18 portfolio standard with the solar electric set aside
19 that helped create demand and investment in the
20 industry. The SREC financing model has provided for
21 long-term contracting to drive investment. In 2007 the
22 State BPU issued its market transition order which
23 advanced the solar alternative compliance payment
24 schedule helping to drive investment. The market
25 transition order has worked.

□

88

1 As evidenced by the SREC trading market for
2 the last few years, SREC prices are driven by market
3 forces, rather than a high ACP. Solyndra appreciates
4 the administration's continued support for solar, as
5 well as its focus on the benefits that solar provides
6 for New Jersey. To that end, the Draft EMP should
7 continue to pursue the goals outlined in the 2007 market
8 transition order, as well as the goals of the Solar
9 Advancement and Fair Competition Act of 2010.

10 The 2007 market transition order is working.
11 Solar REC prices have not been driven by high SACP

12 prices; rather they have been market-driven, as was the
13 hoped for result. With the current supply of SRECs as
14 of June of this year, NJ SREC prices for the 2012 spot
15 market were posted at \$274.46, even though the SACP for
16 Energy year 2011 is \$675 and 658 for Energy Year 2012.

17 Next I'd like to address the continuing use
18 of differentiated energy sources in New Jersey which New
19 Jersey has long relied on. Anticipating increased
20 energy consumption, continued use of a variety of
21 sources, with less reliance on coal-peaking plants is a
22 thoughtful approach for the State's future.

23 The solar industry has grown into a solid
24 contributor for the New Jersey economy in it's
25 manufacturing, sales, employment. And energy

89

1 production. Solar promotes reduced congestion charges,
2 as well as deferred transmission and distribution
3 investments.

4 The administration's focus on solar
5 installations for the commercial and industrial sectors
6 is key to the State's objectives of reducing energy
7 costs and keeping businesses in New Jersey, as well as
8 meeting its environmental goals.

9 Using a market-based approach to the Energy
10 Master Plan is a considerate -- sorry.

11 The Energy Master Plan promotes a
12 market-based approach when considering support for all
13 energy sources. With that in mind, it's important to
14 note that all energy sources come with cost. If
15 incentives and long-term contracting are deemed
16 necessary to promote new nuclear, gas-fired electric

17 generation, or combined heat and power, it follows that
18 the nascent renewable energy industries would benefit
19 from those as well. On a national level, energy
20 subsidies cost about 20 million annually. Fifteen
21 percent of the number is invested in ethanol subsidies,
22 hydropower accounts for 10 percent, and fossil fuels
23 receive 70 percent, with renewables accounting for the
24 remaining 5 percent. These numbers do not take into
25 account the cost for promoting nuclear. The cost for

90

1 research and development for nuclear waste disposal,
2 siting studies, and new technologies is estimated at
3 between 1 and 2 million a year.

4 Finally, the Energy Master Plan goals for
5 renewable energy by 2021. I was very pleased to hear
6 you say last week that the floor will be 22.5 percent
7 rather than the goal, and I hope that we will continue
8 to work toward the 30 percent goal.

9 Finally, I appreciate the administration's
10 continued support for solar, as well as the willingness
11 of all administration officials to meet with all members
12 of the energy community.

13 Thank you.

14 PRESIDENT SOLOMON: Thank you.

15 Steve Hambric.

16 Mr. Hambric.

17 Good afternoon.

18 MR. KAPSIS: Good afternoon.

19 Steve is sitting back there. I'm Jim Kapsis
20 from the same --

21 PRESIDENT SOLOMON: His company.
22 MR. KAPIS: Yes. From Opower.
23 And the last name is K-a-p-s-i-s.
24 President Solomon and Commissioners, thank
25 you for the opportunity to be here today to comment on

91

1 the Energy Master Plan.
2 My name is Jim Kapis. I represent Opower.
3 We are an information enabled energy efficiency software
4 company. We are operating at 24 states, including here
5 in New Jersey and the United Kingdom. By providing
6 customers with better information on their energy use
7 and personalized energy saving advice, Opower motivates
8 customers to use less energy and to save money on their
9 bills.

10 Partnering with almost 60 utilities,
11 including New Jersey Natural, we will deliver
12 personalized home energy reports, all printed by the way
13 here in New Jersey, to 10 million residential customers
14 this year through the mail, that's the mail version,
15 e-mail, website, through phone calls and through text
16 messaging. Through this multichannel engagement, we
17 consistently get up to 85 percent engagement with
18 customers to save an average of 2 to 3 percent on their
19 energy bill and increase the rate of participation in
20 other energy efficiency programs by up to 60 percent.
21 And at the cost of 3 to 5 cents per kilowatt hour, the
22 Opower program is one of the most cost-effective in the
23 market.

24 By the end of next year, we will have saved
25 enough energy to take a hundred thousand off the grid

1 and will have saved a hundred billion dollars in energy
2 bills for households throughout the U.S. These savings
3 are proven and verified. They're consistent across all
4 demographics, including low income, renters, and senior
5 citizens.

6 I'd like to turn to the Energy Master Plan.
7 It certainly has some very good comments on energy
8 efficiency. For example, basically calling it the most
9 effective way to reduce energy costs is to use less and
10 certainly Opower could not agree more and appreciate the
11 State and Governor recognizing that in this plan.

12 However, new policies are needed to create
13 additional energy efficiency investments here in New
14 Jersey. For example, to date New Jersey does lag behind
15 other states throughout the country in realizing the
16 potential of behavior-based or information-based
17 efficiency programs.

18 To give you an example, in Massachusetts our
19 company alone is helping to achieve 24 percent of the
20 residential energy efficiency goal in the State and a
21 number of other utilities, individual utilities, in
22 other states that are using behavior-based or
23 information-based program to achieve upwards of 23
24 percent of the annual efficiency target at a very
25 cost-effective price to the ratepayers.

1 why is behavioral efficiency or
2 information-based efficiency so important and where does

3 it fit in. We'll talk briefly about that. I'm going to
4 ask a question, sort of rhetorical. I think we all know
5 the answer. What is changing your thermostat, turning
6 out the lights, and buying an energy efficiency
7 appliance all have in common? We all have to actually
8 make a decision and make an action that we otherwise
9 would not have taken in order to see that resulting
10 reduction in energy use, whether it's on a daily basis
11 from your thermostat or turning off our lights or
12 whether it's a one-time investment in an appliance which
13 hopefully will give you benefit through its lifetime.

14 If you wanted to note something very good
15 about the master plan which is its focus on
16 cost-effectiveness and on recognizing the tool or
17 resource cost tests as the best way to determine whether
18 efficiency investments are returning sufficiently to
19 ratepayers. The TRC used in more than a dozen states as
20 the primary test of cost-effectiveness of efficiency
21 programs, and New Jersey is very smart to add itself to
22 the list. By employing this test for New Jersey will
23 send a clear signal to the market that only
24 cost-effective efficiency programs will be approved.

25 Second, I want to comment briefly on the

□

94

1 language in the report on customer education and
2 outreach. This is a critical piece and I don't think
3 it's been mentioned yet today. As a company that has
4 expertise in human behavior, we certainly understand how
5 difficult it is to actually get people to do things.
6 And we also understand that energy efficiency
7 technologies over the lifetime of their use really are

8 only as efficient as the people who are using them. And
9 so we have to find ways not only to engage customers on
10 an one-off basis through an advertising campaign or a
11 town hall meeting, not to say that those don't have a
12 role, but we need ongoing engagement with customers to
13 help them better manage their energy use. And I would,
14 on behalf of Opower, suggest that maybe some more detail
15 in the plan about how the State plans to measure,
16 frankly, and verify the results of such engagement with
17 customers. And I would encourage the State to consider
18 information-based or behavioral approaches as one part
19 of the engagement strategy to help customers understand
20 and better use energy and to save money.

21 Finally, I do want to just point out that
22 New Jersey for all the very good things the State is
23 doing on efficiency renewables, it is still behind when
24 it comes to establishing an energy efficiency resource
25 standard. There are more than 20 states that have

95

1 established such a standard, including neighboring New
2 York, Pennsylvania, and Maryland. And New Jersey
3 certainly has it-- it is my understanding the authority
4 to do so and has chosen not to date. In our view in the
5 market in working with states that have such a standard
6 it really does create the type of market that I think
7 New Jersey aspires to with energy efficiency.

8 So we would recommend a mandatory year rest
9 with annual evaluations of program performance using the
10 TRC test which you rightfully pointed out which is an
11 appropriate test for measuring energy efficiency. And

August 3-2011 EMP Public Hearing.txt
12 we believe that will create a robust market for
13 efficiency here in the State.

14 In conclusion, just again to highlight, we
15 would love to see more behavioral approaches in the
16 State, at least acknowledgement in the master plan. And
17 if we're not the only companies doing that, there are
18 other companies engaging in that market. That the TRC
19 test remain very strongly sort of identified as the test
20 of record in New Jersey and that customer education and
21 engagement be held to account for delivery of measurable
22 and verifiable results in terms of saving people money
23 and saving them energy.

24 Thank you so much for your consideration and
25 time and hope to see you all again soon.

96

1 PRESIDENT SOLOMON: Thank you, Mr. Kapsis.
2 Ed Baumann. Good afternoon.

3 MR. BAUMANN: Good afternoon.

4 My name is Ed Baumann, B-a-u-m-a-n-n.

5 President Solomon, it's my hope that you'd
6 be as wise as King Solomon.

7 PRESIDENT SOLOMON: I'm not even close even
8 though we are distantly related.

9 MR. BAUMANN: I'm not one of the suits as
10 you can probably tell; but if I thought I could get up
11 here sooner, I would have wore a suit. I also promise
12 not to read a prepared statement and put you all to
13 sleep.

14 I am a Home Performance expert and working
15 in the Home Performance with ENERGY STAR program.

16 This program that the State subsidized is

17 one of the best programs this state has ever put
18 forward. It addresses many of the concerns of the
19 master energy plan, particularly number three, awarding
20 energy efficiency and energy conservation and reduced
21 peak demand.

22 I wanted to let you know some of the
23 benefits of this program because they're not always as
24 obvious as they seem. First, it increases U.S.
25 manufacturing because a large majority of the equipment

97

1 that we're putting in people's houses is manufactured
2 here in the United States. I assume that solar stuff
3 from America is from the United States, but I remind you
4 also that Mexico is in America, as is Canada by the way.

5 It also lowers the overseas oil dependency
6 because we have a lot of heat and fuel oil in New Jersey
7 and we have a lot of people converting over to natural
8 gas which is much more efficient and saves the residents
9 of New Jersey money on utility bills.

10 We're pouring money into the New Jersey
11 economy because the State is subsidizing work being done
12 in homes of citizens who live here New Jersey. We're
13 lowering greenhouse gases by increasing efficiency of
14 heating equipment and eliminating the fuel oil heating
15 here in New Jersey. We're also building local, small
16 businesses.

17 The people doing this work in this state
18 under this program are the small businesses, the mom and
19 pop operations, the people who live and work here in New
20 Jersey. This is not companies coming into this state.

21 It is not work sought out to companies outside of the
22 State. We're creating jobs here in New Jersey.

23 Everyone of the companies who are working
24 within this program have grown over the last two years
25 and have had to hire more people, people here in New

98

1 Jersey. We're lowering utility bills of citizens of New
2 Jersey, residents, voters. The people, by the way, who
3 are paying that societal benefit fund on their utility
4 bills every month.

5 Now, it's great to add windmills and
6 commercial solar, all of this stuff; but me, in my
7 house, in Flemington, New Jersey, I don't do any of
8 that, but this program does effect me. It effects
9 everyone who owns a home in the State of New Jersey
10 which is probably a large majority of people in this
11 room, including you folks up here, is we're going to
12 lower utility bills for all of these people.

13 we're financing these home improvements.
14 we're helping these people do the improvements that
15 normally they wouldn't be able to afford to do, they
16 wouldn't do. I'm working in houses that are over 200
17 years old. These houses don't have any insulation in
18 them. Some of them have heaters that are 65 percent
19 efficiency. Now, I'm no mathematician but that sounds
20 like a lot of heat going out the chimney. We're making
21 these homes more comfortable at the same time that we're
22 making them more efficient.

23 Now, I realize this doesn't weigh into the
24 Energy Master Plan. But if you don't have a house, I'm
25 sure you know somebody who has a house that the third

1 floor, you know, where Becky's bedroom is and it's
2 always cold in the winter time or hot in the summer time
3 or how about that room over the garage, you know, the
4 one that's never comfortable or the one at the end of
5 the house that's so far away from the heater.

6 PRESIDENT SOLOMON: I don't want to
7 interrupt you when you're on a roll because you're
8 clearly on a roll. You are preaching a little bit to
9 the choir. But if you can confine the comments to the
10 master plan so we know either what to keep, what to get
11 rid of, or what to change. So far you want us to keep
12 the Home Performance.

13 MR. BAUMANN: It's not keeping it is the
14 problem. I don't see it going anywhere. The problem is
15 the emphasis is moving away from the consumers, the
16 homeowners, money has been taken out of this program
17 since its inception.

18 where the master plan needs to change are
19 new goals set. It's important to address the commercial
20 side and government buildings and so forth, but we need
21 to set goals on the residential side. These are people
22 that live here. These are people that vote for these
23 officials. These are the people that are paying for all
24 of this stuff through our taxes and our societal benefit
25 funds. We need to make provisions so that the money

1 that you are paying through the societal benefits fund
2 is not robbed every year by the Governor to pay the

3 State electric bill. That's ridiculous that the program
4 has to stop in the middle to be reevaluated and the
5 funding has to be changed.

6 I have people today who call me up to do a
7 home energy audit in their home that actually -- how
8 long do I have to do this because they know the money is
9 going to be taken away and that is ridiculous. This is
10 a program that is proven. It's in your master plan. It
11 says it's proven. It says it changes energy efficiency.
12 It's addressing many many of the goals in your program.
13 It's important. It needs to be emphasized.

14 what we see, we in this field, is the
15 emphasis moving away from the boots on the ground,
16 people working to save energy in New Jersey, people that
17 pay the bills, the homeowners. And that's really the
18 point I want to get across to the Board today.

19 And I thank you for your time.

20 PRESIDENT SOLOMON: Thank you.

21 I just want to mention, my understanding
22 is -- and again I could be wrong, but I will check it
23 when we leave here today -- is that money was not ever
24 taken out of the program. The program was so popular
25 and successful that the money allocated in the budget

101

1 was used quicker than expected and that resulted in the
2 changes. So we didn't actually decrease the amount. I
3 think it may have actually been increased. But I don't
4 know if Mike Winka is here. I think it was actually
5 increased.

6 On the other hand, we will have the
7 opportunity with the clean energy fund to allocate

8 revenue for all kinds of purposes, including programs
9 that will support residential energy uses just so you
10 know.

11 MR. BAUMANN: Thank you.

12 PRESIDENT SOLOMON: Thank you.

13 Tom Pollock representing Trinity.

14 MR. MERRICK: Ed Merrick representing
15 Trinity.

16 PRESIDENT SOLOMON: Ed Merrick.

17 MR. MERRICK: Tom Pollock is not here today.

18 PRESIDENT SOLOMON: All right. I got you.

19 MR. MERRICK: I have Fred DeSanti is going
20 to be up here today.

21 PRESIDENT SOLOMON: Fred is like the
22 bodyguard. He stands there.

23 MR. MERRICK: My name is Ed Merrick. I'm
24 the Vice President of Trinity Solar.

25 President Solomon, Commissioners, and

102

1 members of the New Jersey Energy Master Plan review
2 commission, I appreciate all the effort done in
3 developing this plan. Thank you for your leadership.
4 And it is an important document that will guide energy
5 policy and how energy is used and perceived in New
6 Jersey.

7 I have about another two, three pages, but
8 I'll skip that.

9 Many of you are familiar with Trinity Solar,
10 but for those who are not, let me briefly tell you who
11 we are. Trinity Solar is a family-owned business

12 operating in New Jersey since 1994. In 2004 we entered
13 the solar industry. In 2007 we officially changed the
14 name to Trinity Solar. And today, just seven short
15 years later, we are the largest installer in New Jersey
16 by a factor of two in terms of total projects in solar.

17 According to information provided by the BPU
18 Clean Energy Program, we have installed more systems
19 than the next three top solar installers combined. In
20 terms of megawatts deployed we rank second with nearly
21 25 megawatts installed, only behind SunPower, an
22 international solar company that is traded on the NASDAQ
23 and has a market cap of 1.9 billion.

24 Today we employ over 350 New Jersey
25 citizens, ten times more than the 35 we employed in

103

1 2007. Trinity solar is the living, breathing example of
2 which you, as policymakers, set out to achieve: A
3 company that operates across a broad spectrum of
4 customers, residential, commercial, and nonprofits; a
5 company that is homegrown, developing permanent jobs in
6 the State; a company that has given back to the
7 community we live in through fundraiser donations such
8 as one we held just last week where we raised \$30,000
9 for the local food bank; a company that contracts
10 directly with local New Jersey based companies, like Big
11 Splash Graphics -- they do all of our trucks. That's a
12 plug for them; Viewer Ford; or even our local food
13 market, Twin Ponds.

14 Through our success, we've been able to help
15 these companies be successful, or at least be able to
16 weather one of the worst recessions we've seen in

17 decades.

18 We have become when New Jersey wanted and it
19 decided to promote solar, employing several hundred New
20 Jersey residents, either directly or indirectly, and
21 serving multiple customer segments, residential,
22 commercial, and nonprofits.

23 Today we wanted to provide a few comments on
24 the Draft EMP and, hopefully, bring to light a few of
25 the inaccuracies and misconceptions that we believe

104

1 exist with within the EMP, as well as the general public
2 when it comes to solar energy, particularly, solar
3 energy for homeowners and families. We also wish to
4 respectfully outline a few recommendations on additional
5 actions our State government can pursue to improve the
6 use of our limited energy resources.

7 First, let's turn our attention to the
8 misconception that solar is for the wealthy, as espoused
9 in hearings in Newark last week. All of that may have
10 been true in the past, solar for homeowners is no longer
11 out of reach for a lot of New Jersey families. With
12 merely 2,300 homeowners with Trinity Solar systems on
13 their roofs, we know who our customers are and you can
14 believe us when we tell you they are not just the
15 wealthy. In fact, the truth of the matter is that the
16 wealthy typically don't buy solar for a simple reason,
17 they don't need it. They can afford their energy bills.
18 In addition, many times their roofs are so elaborate
19 that you can't fit a solar system on it anyway.

20 We can point to the -- the families that do

21 need the savings are the ones going solar. Some are
22 preparing for a future on fixed incomes. We can point
23 to 300 retirees that now have solar because of us, as
24 well as the nearly 250 military service families that
25 have gotten solar with the Trinity Solar systems. These

105

1 people have gone to solar so they can cut their electric
2 bill, redirect the savings to paying their mortgage,
3 their healthcare costs or college tuition for their
4 children. Of course, some other people do buy solar.
5 They're certainly middle class, average New Jersey
6 homeowners.

7 with the introduction of power purchase
8 agreements, PPAs, into the residential segment, now
9 homeowners can buy solar for less than a thousand
10 dollars and get a reduction on their electric bill. At
11 least in New Jersey solar is not restricted to the rich
12 and the wealthy. Thanks to you and your policies it's
13 for everyone.

14 We at Trinity believe solar for homeowners
15 is an important and critical part of any solar program
16 instituted by a government. We're not alone in this
17 belief. Solar City and Google City and SunPower and Sun
18 Run and U.S. Bank Corp., and even Sun Edison, Inc., and
19 EMC, a few of the largest companies in the solar
20 industry are either focused on residential or moving
21 that way.

22 The residential segment is an important part
23 of the overall solar market that drives many of the
24 benefits you see. It's more effective than any other
25 segment in creating permanent New Jersey based jobs. It

1 allows a majority of the public to participate in solar
2 rather than simply the large corporations. It provides
3 the bridge for small solar installation companies to
4 grow in the commercial segment, as case in point for
5 2007 Trinity predominantly installed residential
6 systems. Today half our business is from the commercial
7 segment and we are one of the top commercial installers
8 in the State. Most of our commercial projects come from
9 people to whom we sold residential systems.

10 All of the costs for residential systems are
11 slightly higher than commercial systems. The cost
12 difference isn't as high as shown in the EMP. We will
13 provide comments in writing as to why this is the case.

14 Next let me turn my attention to the
15 benefits of distributed generation associated with
16 residential solar specifically. Distributed generation
17 benefits or public utility infrastructure are maximized
18 with the use of residential solar applications. These
19 benefits save utility customers by significantly
20 reducing the thermal damages to utility plants resulting
21 from high currents during the peak demand periods.
22 Substation transformers and switch gear are operated at
23 lower temperatures and pass lower electric currents when
24 distributed residential products operate to reduce
25 demand during these periods.

1 Over time this means that utility substation
2 and switching station infrastructure will typically last

3 longer and operate more reliably reducing outages during
4 peak periods. Underground cable is typically employed
5 at the head of the distribution service can enjoy a far
6 greater life without interpretation -- I'm sorry --
7 interruption also has a direct result of residential
8 distributed generation.

9 The same benefits do not generally apply
10 with grid based interconnected solar applications. In
11 this case, particularly in the solar installations
12 exceeding 10 megawatts in size, the distribution
13 circuits cannot themselves handle this point source of
14 generation injection and reduce current flows to the
15 substation level -- substation level do not occur.

16 Additionally, utility interconnections are
17 far easier to accommodate and far less costly than the
18 residential applications. From the perspective of
19 utility operations, residential solar installations
20 minimize circuit disruption from voltage bumps that
21 occur when passing clouds can interrupt the continuity
22 of the generation.

23 Similar to water hammer and domestic piping
24 systems, larger commercial and grid based solar rays can
25 create serious voltage swings impacting other customers

108

1 on the circuit. Without mitigation these projects can
2 result in service quality issues to other customers on
3 the circuit. Distributed generation represents an
4 important area of value creations and residential
5 applications maximize those value to the benefit of
6 ratepayers because investment in utility infrastructure
7 and operation is maximized.

8 As for recommendations, we believe that the
9 administration should continue to support distributed
10 generation net metered projects, especially residential.
11 Now that residential rebates are eliminated -- by the
12 way, Trinity was one of the first to recommend that they
13 be eliminated -- we would expect that this should not be
14 an issue as it pertains to residential as an SREC. An
15 SREC is an SREC, whether it comes from a home, a church,
16 or synagogue or commercial building.

17 With regard to the policy direction and
18 recommendations that were made in the EMP, we have a
19 couple of additional statements. One is with regard to
20 reducing the SACP. At Trinity we do not support
21 reducing the SACP. We believe it is the stick to ensure
22 that LSEs win toward long-term contracts. If you reduce
23 the SACP cap, one, there's less incentive to issue
24 long-term contracts by LSEs. Two, it demonstrates the
25 stakeholder -- to all stakeholders that the

□

109

1 administration will and can move the yardstick with the
2 stroke of a pen.

3 This creates uncertainty in the minds of
4 those financing these projects, which are skeptical of
5 solar. It's still relatively new and, therefore, raises
6 the financing costs. We need stability and certainty.
7 The Solar Advancement Act is working which is just to be
8 left alone to work as intended.

9 We support a cost benefit test as long as
10 the test is fair, unbiased, and has an open public
11 debate of the results prior to the implementation of any

August 3-2011 EMP Public Hearing.txt
12 findings. Given our job growth, the distributed
13 benefits of net metering systems and the current
14 projected future cost of solar, we believe solar would
15 fair well.

16 We do not support the notion that
17 brownfields and landfills are well-suited for
18 development. Conceptually it sounds like a good idea.
19 In practice we believe it presents some challenges.

20 Many of these projects will be higher in
21 costs due to the requirements of prevailing wage and
22 will be many grid connected systems, thus losing the
23 benefit of net metered systems. Although it is land, a
24 thorough analysis should be conducted before supporting
25 such projects.

110

1 We do agree that productive farmlands should
2 not be turned into solar fields. These projects are no
3 other than the developers. They do not promote
4 long-term job growth and do not provide distributed
5 generation benefits I spoke about earlier.

6 Lastly, although the EMP states a
7 difference, it is unclear why or how behind-the-meter
8 commercial projects are any different than
9 behind-the-meter residential projects. They both will
10 produce SRECs.

11 In fact, residential projects due to higher
12 tilt angling will produce more SRECs on the system than
13 commercial buildings with flat roofs. A thorough
14 analysis of the benefits of residential solar systems
15 should be conducted, equally the cost side of the
16 equation should also be assessed. As many of the

17 increased costs come from local ordinances or municipal
18 permitting in interconnection requirements.

19 The administration can help lower some of
20 those costs by supporting bills that will lessen the
21 paperwork and red tape that is required today to be a
22 solar installer.

23 We believe the administration should not
24 continue to allow regulated utilities to compete for
25 SRECs against nonregulated entities. We believe that

111

1 the Solar 4 All program should not be renewed. It was a
2 one-time program meant to bridge New Jersey from a low
3 supply of SRECs to where we are today. We are on course
4 to meet the RPS. Such programs as for the Solar 4 All
5 program are no longer needed.

6 However, we do support the continuation of
7 SREC-based financing programs. We believe additional
8 emphasis should be placed on energy efficiency. It goes
9 hand in hand with solar and we were just getting our
10 team off the ground when energy efficiency funding was
11 pulled.

12 Just as a matter of note, we have about 20
13 to 25 salespeople in people's homes every day, we're
14 talking about solar, but also we're talking about energy
15 efficiency. Rather than fund energy efficiency through
16 some sort of rebate or other financing mechanism, there
17 are other signals that can be used to incentivize demand
18 and peak production. One such signal would be through
19 the structure of electric rates.

20 Currently, there are no disincentives to

21 using excess power. The cost for each kilowatt hour is
22 the same whether one uses 5000 kilowatt hours or 15,000
23 kilowatt hours. An inverted tiered block structure for
24 electric users paying more when they cross certain rate
25 tiers could make sense.

112

1 we've seen it work in other states and
2 suggest that at least an analysis of the viability of
3 such a structure be evaluated.

4 Lastly -- and I probably said lastly about
5 seven times now.

6 PRESIDENT SOLOMON: And I think you're about
7 15 minutes. That means that there are about eight
8 people that will not get to speak today. This is the
9 guy you can blame just so you know.

10 MR. MERRICK: It has been suggested that the
11 format of the BGS auction and inclusion of SRECs in the
12 auction presents barriers to understanding the true cost
13 of SRECs.

14 PRESIDENT SOLOMON: Slow down. She can't
15 take that.

16 Just give us the fixed amount. We
17 understand realtime pricing and the tier. We understand
18 that.

19 MR. MERRICK: Going on to the BGSS auction,
20 my one comment is that just looking at unbundling that
21 from SRECs.

22 Thank you for the opportunity to speak.

23 PRESIDENT SOLOMON: Sorry to cut you off.
24 If people when they speak, if they can give us the
25 proposals. I think we understand most of them. If we

1 don't and need your support for it, we'll ask you. And
2 this is not a criticism because I understand everybody
3 has something they want to explain so we understand it.
4 I think we understand it. If we don't, we'll tell you.
5 If you can condense what you have to say to here are the
6 suggestions and here is why, we may get everybody in
7 today. Otherwise, people will not be speaking.

8 Thank you very much.

9 And thank you, Fred.

10 I'm going to allow Commissioner Fiordaliso
11 to take over here. I have to do one thing outside for
12 two seconds so I will be back.

13 COMMISSIONER FIORDALISO: Our next speaker
14 is Andrew Young.

15 MR. YOUNG: Good afternoon.

16 My name is Andrew Young and I work for
17 Salmon Ventures, Limited. We are have a nationally
18 recognized consulting firm based in Millburn, New
19 Jersey. And I want to thank you for allowing us the
20 opportunity to present comments on the 2011 Draft New
21 Jersey Energy Master Plan.

22 Salmon Ventures represent clients from all
23 segments of the energy picture from generation and
24 distribution companies down to small businesses that
25 provide energy consulting and install energy efficiency

1 equipment in both commercial and government facilities.

2 As a matter of policy, Salmon Ventures

3 supports the five overarching goals of the EMP. We
4 specifically support the development and utilization of
5 new technologies and regulations that help consumers
6 reduce their energy usage. The old adage that the best
7 kilowatt is one that isn't produced is true.

8 Smart meters, incentive rates, dynamic
9 pricing, innovative technologies, and consumer education
10 should be the cornerstones of the EMP.

11 Salmon Ventures believes that the
12 development of new rate structures and methodologies are
13 required to enable customers to save money and energy
14 without negative effects on utility cost recovery. The
15 administration of energy efficiency programs funded by
16 ratepayers should be performed by the electric and gas
17 utilities even their natural link to the end use
18 customer.

19 Cost of administration should be minimized,
20 our rates, balanced with requirements for lowering
21 energy usage. We support measurable targets for energy
22 efficiency and clear accountability for achieving those
23 reductions. We would urge the administration and the
24 BPU to determine what delivery mechanisms and incentives
25 are best for achieving the goals set out in the EMP for

115

1 achieving energy efficiency.

2 That's all I have today and thank you for
3 the opportunity.

4 COMMISSIONER FIORDALISO: Sam wolfe.

5 MR. WOLFE: Thank you, Commissioners,
6 members of the panel for the opportunity to testify
7 today.

8 My name is Sam Wolfe, w-o-l-f-e, and I'm
9 Managing Director for Legal and Regulatory Affairs at
10 Viridity Energy.

11 THE COURT REPORTER: Could you hold on?

12 COMMISSIONER FIORDALISO: Can you ask those
13 people to close that door?

14 Sorry, Sam.

15 MR. WOLFE: And I apologize, Viridity is
16 V-i-r-i-d-i-t-y, Energy.

17 Viridity helps large electricity customers
18 maximize the revenues they can earn from the PJM
19 wholesale electricity markets.

20 I would like to testify briefly and focusing
21 on one particular point of the proposed EMP which is in
22 Section 7.3. There's a suggestion of reevaluating what
23 the State does to support energy efficiency and demand
24 response and specifically poses the question whether PJM
25 wholesale market already provides an adequate

□

116

1 compensation to ensure the success of these programs.

2 what I'd like to do is suggest that a
3 different question will shed a whole lot more light on
4 what the State needs to be doing going forward with
5 respect to demand response. And the question is whether
6 additional demand response can provide greater savings
7 to New Jersey electricity customers which we're already
8 seeing from demand response.

9 Just to put a marker down here to the kind
10 of money we're talking about. The LCAPP projects
11 savings of about \$1.8 billion over 15 years starting in

12 2015. I would like to compare that with what demand
13 response did in various markets very recently. In the
14 2013/2014 base residual auction for capacity at PJM, the
15 market monitor compared what the results of that auction
16 would have been in New Jersey and elsewhere in the
17 region had demand response and energy efficiency not
18 been present.

19 So the actual clearing price for Eastern
20 MACC region would have been about \$390 in the absence of
21 demand response. The actual clearing price with several
22 thousand megawatts of demand response present was about
23 \$245 in New Jersey. Let me translate that. The total
24 cost had there been no demand response present would
25 have been about \$3 billion for that one year for New

117

1 Jersey electricity customers. With demand response in
2 the market, the total cost was about \$1.9 billion. So
3 we're talking about a \$1.1 billion savings in one year.

4 So the first subquestion is whether demand
5 response with increased support can provide greater
6 savings for New Jersey customers on capacity. The same
7 question comes up in the energy market. And I think
8 everybody has heard this story about when PJM hit its
9 peak in August of 2006, PJM paid about \$5 million to
10 support demand response during a one-year period -- I'm
11 sorry -- a one-week period.

12 During that same week as a result of the
13 presence of demand response, it was about \$650 million
14 of savings to end use customers. So the \$5 million cost
15 of the program and \$650 million in savings. So the same
16 kind of question needs to be asked whether additional

17 support for demand response can provide additional
18 savings for customers in the energy market as well as
19 capacity market.

20 The last point is on reliability and here is
21 look to a different state that's similar to New Jersey
22 and that's Maryland. About three years ago when
23 Maryland saw that there were major transmission projects
24 that were likely to be delayed, the Maryland Commission
25 took action and directed electric utilities in the state

118

1 to procure several hundred megawatts in demand response
2 capability and that was seen as filling the gap and
3 ensuring reliability while those transmission lines were
4 being delayed.

5 So, again, the question which needs to be
6 asked is: Can additional demand response in the market
7 help to ensure reliability to a greater degree than
8 we're already seeing?

9 So and, again, looking to the Maryland
10 model, whether it should be considered to have utilities
11 in New Jersey procuring solar energy demand response to
12 make up for the delays in transmission lines and also to
13 achieve the savings that we talked about in the energy
14 and capacity markets.

15 Thank you very much for the opportunity to
16 testify.

17 COMMISSIONER FIORDALISO: Thank you, Sam.
18 Fred Zalcmán.

19 MR. ZALCMAN: Good afternoon, Commissioner
20 Fiordaliso and the other members of the Energy Master

21 August 3-2011 EMP Public Hearing.txt
Plan committee.

22 My name is Fred Zalcman, and I'm testifying
23 today on behalf of Sun Edison, one of the nation's
24 leading solar energy developers. We've been an active
25 participant in the New Jersey solar market since its

119

1 launch nearly a decade ago and abiding interest in its
2 continued growth and progress toward
3 self-sustainability. Sun Edison currently owns and
4 operates a fleet of nearly a hundred solar generating
5 systems across the State totalling 13 megawatts in
6 capacity. Much of the design, engineering, and
7 construction management for Sun Edison systems
8 throughout the Mid-Atlantic region is done out of
9 Pennsauken regional office.

10 We very much appreciate the careful thought
11 and analysis underlying the Draft Energy Master Plan, as
12 well as the significant challenges facing the Christie
13 Administration as it seeks to optimize the State's
14 energy portfolio to meet long-term economic and
15 environmental objectives.

16 My testimony today focuses on five specific
17 policy areas that will enable the state to meet
18 aggressive annual targets for solar energy generation at
19 the lowest possible cost and broadest distribution of
20 benefits to ratepayers. We stand ready to assist the
21 BPU and other relevant state agencies in the pursuit of
22 these policies.

23 First, as has been eluded to already by
24 several speakers, our primary recommendation is for the
25 Board to establish a 15 year solar alternative

1 compliance payment schedule that encourages load serving
2 entities to enter into long-term SREC contracts. As has
3 already been mentioned, the Solar Advancement Act
4 obligates the Board to set a 15 year SACP schedule.
5 Unfortunately, that schedule has been allowed to lapse
6 such that market participants now have visibility only
7 through 2016.

8 This regulatory uncertainty has frustrated
9 long-term SREC contracting insofar as LSEs are reluctant
10 to enter into contracts that may be out of the money
11 once future SACP prices are set. This wait-and-see
12 approach, while clearly prudent from the LSE's
13 perspective, has resulted in an unhealthy overreliance
14 on the speculative and high priced spot compliance
15 market.

16 Moreover, the solar alternative compliance
17 payment schedule must be carefully set to provide the
18 economic viability of New Jersey solar projects. While
19 solar PV is a declining cost industry well on its way to
20 achieving grid parity in several important U.S.
21 electricity markets, we would counsel against using the
22 more dramatic solar cost reduction seen over the last
23 two years as a basis for setting a long-term SACP.

24 In a nutshell, solar module costs are driven
25 by market dynamics in the global marketplace. Over the

1 last two years we've seen something like a 40 percent
2 drop in solar module costs and that's really a result of

3 the convergence of two factors. First, new solar module
4 production capacity is coming online precisely at the
5 moment when major incentive markets, particularly in the
6 European union have been retrenching their programs. So
7 that's resulted in a global oversupply of capacity,
8 significant in price drops. And while that certainly
9 advantage downstream developers like Sun Edison and the
10 customers we serve, again that short-term phenomenon
11 really shouldn't serve as the basis for setting the
12 SACP.

13 Our concern is that if the Board institutes
14 too precipitous a drop based on the short-term cost
15 reduction, the New Jersey market could well stall as a
16 solar market, again comes into the balance and the SACP
17 outpaces true solar cost reductions. And payment of the
18 SACP once again becomes the least cost strategy for load
19 serving entities.

20 Our core recommendation in this area,
21 therefore, is that the Board should maintain the current
22 two and a half percent annual rate of decline through
23 2025. If the Board adopts a one-time adjustment to
24 capture a more recent decline in module costs, this
25 true-up cannot exceed 4 and a half percent.

122

1 Second and relatedly, the EMP should broaden
2 its support for local energy self-determination through
3 long-term contracting. The EMP advances the LCAPP as
4 the necessary market support mechanism to provide
5 independent power producers with long-term revenue
6 certainty and stability they require to secure project
7 finance for new in-state gas-fired combined cycle

8 generation assets.

9 Although not discussed in the EMP, the EDC
10 SREC finance program fulfills much the same purpose for
11 solar resource development by securitizing the SREC
12 revenues associated with customer sited solar projects.
13 This program is proven instrumental in facilitating the
14 achievement of New Jersey's annual solar goals while
15 driving down the overall cost of compliance.

16 Further, the program has really eased
17 reliance on the spot market for the purchase of SRECs.
18 As evidenced by the most recent auction, participation
19 in the program continues to increase with over four
20 times the amount of capacity bid as available, even as
21 the weighted average market and clearing price for SRECS
22 continues to drop.

23 Now, while the fate of LCAPP remains
24 uncertain, the EDC SREC finance program lies squarely
25 within the BPU's policymaking discretion.

123

1 Unfortunately, without further Board action this
2 successful program will expire at the end of 2011. Sun
3 Edison respectfully urges the Board to take prompt
4 action to extend and expand this initiative.

5 Thirdly, New Jersey's interconnection
6 standards must be updated to accommodate the future
7 deployment of in-State distributed generation sources.
8 New Jersey's current interconnection rules were
9 instituted nearly a decade ago when for all practical
10 purposes solar PV and other forms of distributed
11 generation were in their infancy.

12 Although these rules have served the State
13 well as witnessed by the explosive growth and ubiquity
14 of these systems across the State, it's equally clear
15 that they must be modernized to reflect the current
16 state of technology and the accumulated experience for
17 interconnecting and safely operating these systems in
18 conjunction with the local grid.

19 Moreover, these rules reflect a level of
20 conservatism acceptable at a time when DG Systems
21 numbered in the single digits but that now represent an
22 impediment as these in-State resources acquired to
23 become a significant part of the State's overall
24 resource mix.

25 Now, there are a number of changes, specific

124

1 changes to the Board's interconnection rules that can
2 and should be pursued through the BPU's ongoing net
3 metering and interconnection stakeholder process and
4 we're certainly happy to work with Board staff and other
5 stakeholders to pursue these changes.

6 Fourth, the EMP should address equity
7 concerns by enabling more New Jerseyans to directly reap
8 the benefits of stable priced solar PV. While
9 acknowledging the attractiveness of PV to the customer
10 host, the Draft EMP laments the potential for
11 cross-subsidization by nonparticipating customers.

12 Now, in our view the EMP's claims of
13 cross-subsidization are grossly exaggerated. And as a
14 comprehensive cost-benefit analysis will demonstrate,
15 these may be nonexistent to the extent market price
16 oppression effects and other wholesale effects and other

17 avoided costs are fully accounted for in the analysis.
18 However, to the extent any residual cost-ship does
19 occur, this can be mitigated through actions already
20 drafted in the -- already recommended, rather, in the
21 Draft EMP.

22 Rather than by constraining future solar
23 goals, just to cite one example, Sun Edison supports the
24 draft EMP's call for community renewables. A community
25 renewables initiative wherein consumers acquire a

125

1 fractional interest in the centralized solar facility
2 will enable scores of New Jersey consumers who may
3 otherwise lack the capital or access to sunlight to
4 directly benefit from this clean, abundant, stable
5 source resource.

6 And, lastly, the State should address a
7 range of local permitting barriers that inhibit the
8 widespread deployment of PV. Local planning and code
9 officials certainly play an important role in ensuring
10 the solar installations comport with the community's
11 aesthetic standards and safety concerns. Nonetheless,
12 all too often our industry encounters local municipal
13 ordinances which overreach in their regulation of PV
14 placements. And, further, we often encounter local
15 permitting processes that are onerous and antiquated and
16 result in unnecessary time and cost in the permitting
17 and inspection process. And, certainly, this isn't
18 unique to New Jersey. A recent report concludes that a
19 local permitting and inspection adds about 50 cents a
20 watt or \$2,500 to the average U.S. residential system.

21 Now, in the interest of time I won't go into
22 all the specifics but suffice it to say that again there
23 are several constructive steps that the state can take
24 to address this issue. We encourage State agencies,
25 such as the Board of Public Utilities through its

126

1 Division of Economic Development and Energy Policy and
2 the Department of Community Affairs to work with local
3 officials and other stakeholders to address these
4 barriers.

5 Thank you for your attention and I
6 appreciate your consideration on these matters.

7 PRESIDENT SOLOMON: Thank you.

8 Christopher Brown.

9 Christopher Brown.

10 Erich DeGesero.

11 MR. DeGESERO: Good afternoon.

12 Erich DeGesero, D-e-G-e-s-e-r-o.

13 Good afternoon, President Solomon and
14 Commissioners. My name is Erich DeGesero. I am the
15 Executive Vice President of the Fuel Merchants
16 Association of New Jersey. We represent small business
17 owners in New Jersey who distribute home heating oil,
18 gasoline, diesel fuel, and also provide home comfort
19 services, such as central heating and air-conditioning,
20 installation and service, as well as a number of them
21 participate under the BPU or through the BPU's Office of
22 Clean Energy, Home Performance with ENERGY STAR program.

23 To say we are disappointed with Draft EMP is
24 an understatement. Our disappointment is not that
25 policymakers are looking to incentivize solar and wind

1 and encourage energy conservation. We recognize there
2 is a role for renewables to play in the energy mix as
3 our members have been selling energy conservation for
4 the better part of 40 years.

5 Unfortunately, this proposal fails to
6 recognize the role that our members play in the energy
7 mix. While much public policy, both at the federal and
8 state level, is directed towards renewable fuel, the
9 energy information administration estimates that the
10 year 2035, 78 percent of our nation's primary energy
11 needs will continue to be met by fossil fuels -- coal,
12 oil, and gas. While this document seeks to redefine
13 renewables to include natural gas, it cannot change the
14 fact that natural gas continues to be a fossil fuel.

15 Our industry has worked with policymakers at
16 both the state and federal level to not only to improve
17 the formulation of our fuel to make it more
18 environmentally friendly, but also dramatically increase
19 efficiency and performance of our equipment to reduce
20 annual fuel consumption.

21 Unfortunately, the Draft EMP refuses to
22 recognize any of these improvements and is content in
23 consigning what our members sell and, unfortunately, our
24 members themselves to extinction. Simply put, this
25 Draft EMP favors one fossil fuel, natural gas, over all

1 the others.

2 There are two primary reasons the Draft EMP

3 raises relative to fossil fuels our members sell as
4 opposed to those that the document endorses. One is
5 those fossil fuels our member sells are not
6 environmentally benign and, two, is that they're more
7 expensive.

8 Specifically on page 115 of the draft it
9 states: Since publication of the 2008 EMP, natural gas
10 has become a more attractive energy source, largely due
11 to lower commodity cost and fewer emissions of
12 pollutants.

13 Relative the pollutants, our industry has
14 made dramatic progress in reducing the two largest
15 sources of emission release based deficiency relative to
16 our other primary fossil fuel competitor, natural gas.

17 The first is relative to particulate
18 emissions. This point has been amplified or has been
19 codified, I should say, by the in U.S. EPA in their
20 publication AP42, 4th Edition.

21 This point was also amplified the
22 Northeastern States for Coordinated Air Use Management,
23 NESCAUM, that's the air regulators in the northeast, who
24 stated, quote, properly adjusted oil burners now use
25 particulate matter emissions --

□

129

1 PRESIDENT SOLOMON: When you're reading,
2 you're going to have to every third word stop. Okay.

3 I just don't -- I'm worried. I kept her
4 going and didn't take any breaks. Usually we'll take a
5 10- or 15-minute break. So unless you and everybody
6 else slows down when they speak, we're going to start
7 taking breaks and that will cut a lot of them.

8 Okay. Thank you.

9 MR. DeGESERO: I apologize and I promise I
10 will absolutely speak slow.

11 Properly adjusted oil burners now produce
12 particulate matter emissions that are similar to natural
13 gas burners. Additionally, the other issue that we have
14 is relative to sulfur in that our industry actually took
15 the lead in championing the reduction of sulfur in the
16 content of heating oil and supported the DEP's proposal
17 which was adopted last year which reduced sulfur content
18 in heating oil.

19 Relative to greenhouse gas emissions, our
20 industry has also worked to include renewable component
21 in heating oil renewable fuel. We successfully worked
22 to have the definition of the heating oil and diesel
23 fuel amended by ASTM, the American Society for Testing
24 and Materials, to include a renewable component. The
25 importance of that is that existing fuels and existing

130

1 vehicles can run on fuel that now has up to a 5 percent
2 biofuel blend in it.

3 We are also working to develop the next
4 generation of biofuel to find out how much higher we can
5 go in the formulation of the renewable component in
6 utilizing the existing infrastructure that is out there.
7 All new heating systems are biofuel compatible.

8 Much attention is also focused over the
9 years on some greenhouse gases, such as carbon dioxide
10 which is the primary greenhouse gas component in heating
11 oil; but far less attention is paid to methane which is

12 a primary component of natural gas. We have now begun
13 to see that the State department and ICCC are
14 recognizing that methane is on a 20-year horizon
15 actually a much greater concern than is carbon dioxide.

16 Once the life cycle greenhouse gas emissions
17 of heating oil and natural gas are taken into account at
18 the point in the future that we are working towards
19 where heating oil has a 20 percent renewable component,
20 the greenhouse gas footprint of heating oil will be less
21 than that of natural gas. At 10 percent we're tied and
22 at 20 percent we are less.

23 The Draft EMP also discusses the advantage
24 of biofuels for diesel for mass transit. Why not
25 incorporate it into home heating oil as the 2008 draft

131

1 did when it required a biofuel component. Additionally,
2 New York City is requiring such a component beginning in
3 2012.

4 Finally, relative to climate change, a
5 recent study Robert Haworth published in Climate Change
6 Letters in March of 20, 2011, finds that methane
7 emissions from the hydraulic fracturing of shale gas
8 contributes at least 20 percent more, if not double, to
9 greenhouse gas emissions than does burning coal. So we
10 think that relative to environmental emissions, whether
11 it be traditional pollutants or it be greenhouse gas, we
12 have a pretty good story to tell.

13 Relative to motor fuels, the draft seems
14 disappointed that it can't more easily displace gasoline
15 and diesel with motor fuels. Why is the State
16 dismissing the biofuels as the draft does because there

17 may not be a subsidy in the near future for biofuel but
18 is quick to support state and regional incentives for
19 CNG vehicles, although the draft does not specify what
20 those incentives should be.

21 We would encourage there to be a look at
22 natural gas to liquid technologies which would allow for
23 the utilization of the existing fueling infrastructure
24 and also commend the Board for recognition that
25 alternative fuels enjoy statutory advantage relative to

132

1 the motor fuel tax and the greater utilization and
2 encouragement will put even greater pressures on the
3 transportation trust funds funding source that is there
4 currently.

5 Relative to pricing, the Draft EMP states
6 that as a justification for its endorsement of natural
7 gas as a fossil fuel of choice, it uses reasoning that
8 natural gas would be less expensive than oil using such
9 objective metrics as conventional wisdom and fundamental
10 dynamics which portend a wide price differential going
11 forward. This is the same conventional wisdom which
12 driven by experts, like Aubrey McClendon, the CEO of
13 which Chesapeake Energy, and Alan Greenspan portended
14 natural gas today would be \$10 a decatherm and we would
15 need to be importing LNG to meet our needs.

16 Admittedly, predicting the future is a
17 difficult task and there is a long-term -- and if there
18 are a long-term sustained dislocation between fossil
19 fuel competitors, the market will figure it out. It
20 should not be the role of this Energy Master Plan to

21 decree which fossil fuel wins and which fossil fuel
22 loses.

23 The heating oil industry has also sold
24 energy efficiency for decades. The average home that
25 used to consume about 1400 gallons a year, now consumes

133

1 less than 900. And with the advance of new fuels,
2 specifically reducing sulfur, we can expect that
3 consumption to be cut by more than a third again.
4 Unfortunately, the direct inclusion of heating oil
5 equipment upgrade in the existing Clean Energy Program
6 has been opposed by the Board.

7 The FMA believes that any change in the
8 delivery in energy efficiency measures must include all
9 fuels, regardless of the ownership of the entity which
10 is supplying the BTUs. Furthermore, any transition in
11 the delivery of energy efficiency programs cannot
12 disadvantage the small business HVAC contractors who
13 provide the services to homeowners and businesses.

14 In conclusion, FMA urges the draft not be
15 adopted, rather it be revisited to recognize the
16 contribution of all fossil fuel forms of energy and need
17 of diversity of energy supplies in the State.

18 Thank you.

19 PRESIDENT SOLOMON: Thank you.

20 Katie Bolcar.

21 MS. BOLCAR: I asked to have them take it
22 off.

23 PRESIDENT SOLOMON: I'm sorry. What?

24 MS. BOLCAR: I asked for my name to be
25 removed last week.

1 PRESIDENT SOLOMON: Okay. Never mind. I'll
2 take it out.

3 Dante DiPirro.

4 PRESIDENT SOLOMON: Make sure you both
5 identify yourselves.

6 MR. DI PIRRO: Dante Di Pirro, D-a-n-t-e,
7 D-i, capital P, i-r-r-o.

8 MR. FLEISCHER: Howard Fleischer,
9 H-o-w-a-r-d, F-l-e-i-s-c-h-e-r.

10 MR. DI PIRRO: President Solomon,
11 Commissioners, members of the panel, thank you for the
12 opportunity to comment --

13 PRESIDENT SOLOMON: Speak slowly. Okay?

14 MR. DI PIRRO: Yes. Right.

15 Thank you for the opportunity to provide
16 comments on the Energy Master Plan. I'm an attorney in
17 private practice. I have approximately 20 years of
18 experience in the energy and environmental fields;
19 first, with the State of New Jersey in various
20 capacities and currently in the solar industry where I
21 have written and negotiated about 20 megawatts of new
22 solar construction.

23 with me is Howard Fleischer.

24 MR. FLEISCHER: I have been in the solar
25 industry for seven years and managing partner of

1 NJSREC.COM which is one of the largest aggregators in
2 New Jersey with 1600 customers. I'm a former

August 3-2011 EMP Public Hearing.txt
3 environmental commission chairman in a local
4 municipality. This is my 40th year as a business person
5 in New Jersey.

6 MR. DI PIRRO: And today we wanted to
7 address the members of panel about the solar industry
8 and specifically about the SREC market.

9 We have a short PowerPoint.

10 But the SREC is very important, as all of
11 you know, to New Jersey because it's the primary
12 incentive now for the solar industry. We're all aware
13 that it's an emerging market and we've experienced at
14 some points what we think is unnecessarily high SREC
15 prices.

16 Even now, of course, we're experiencing a
17 significant decline in those prices. High prices place
18 unnecessary costs on ratepayers which is a problem and
19 at the same time it puts the solar industry green jobs
20 and the economy at risk to kill the proverbial golden
21 goose who's laying all those golden eggs in an economy
22 that otherwise is experiencing a lot of difficulty here
23 in New Jersey.

24 The low prices are also a big problem. They
25 create uncertainty on the part of New Jersey owners,

136

1 businesses who are trying to put solar onto their
2 facilities and that risk is stalling our green economy
3 and risking the prestige of New Jersey as a leader in
4 renewables.

5 The proposal we want to present today is for
6 market tuning. Now market tuning would not pick winners
7 and losers and it would not be a governmental control

8 over the market. But what it would do is establish
9 market parameters so the market runs efficiently and it
10 then could then run and let it run within an established
11 market trading range. We point out that tuning is not
12 uncommon. It's something that, for example, the fed
13 does when it intervenes with the money supply.

14 In sum, our tuning has three essential
15 elements: To establish an SREC at floor price; to
16 establish an SREC ceiling price; and to establish a
17 mechanism that would cap the number of projects that can
18 be constructed and provide a fair method to improve a
19 project in the event of a glut of applications.

20 And we have two graphs that we would like to
21 walk you through to explain the details of that.

22 MR. FLEISCHER: Before I go through the
23 graphs, I just want to mention that SREC pricing in New
24 Jersey was in the mid 600s about a month and a half ago.
25 This morning it was below \$200. That is at the utility

137

1 level.

2 The upper line on our graph shows the
3 existing SACPs and using a 2 and a half percent per year
4 reduction in what the SACP would be out to 2026. We
5 think that those SACPs are too high and not necessary to
6 sustain solar in New Jersey.

7 The second line which starts at \$500 in the
8 year 2013, this plan starts at the year 2013, is reduced
9 to about \$15 a year for the year 2026. We're suggesting
10 that those be the SACPs adopted.

11 There is a floor price which is -- starts at

12 \$200 and goes down \$5 a year. And let me just emphasize
13 that these are suggested parameters. This is a
14 spreadsheet. This can be raised up; this can go down
15 according to the needs. This is a guideline. So I'm
16 sure there are plenty of folks that have opinions on
17 both sides of this.

18 Essentially, what we want to do is propose a
19 trading range. That's the market. That is the market
20 we would work within. If we are to establish a trading
21 range, we also need to take care of a couple of other
22 items. And one is that we have to have a mechanism that
23 if the solar SREC price goes down towards the floor,
24 there's a mechanism to increase the RPS so we can build
25 more solar in New Jersey because it's not going to cost

138

1 us any more money to do so.

2 And the second chart shows the following:
3 Basically the bottom line on the chart shows what these
4 numbers would be under the current bill. That is 83520.
5 The second line is a 20 percent suggested increase in
6 the RPS when the trading price is \$50 above the floor
7 for a determined period of time. The upper line is when
8 the trading price is at the floor for a sustained period
9 of time. It's a 50 percent increase in the RPS now. We
10 have nothing against further increases in RPS, but these
11 are suggested guidelines.

12 In order to implement this and to be fair to
13 all the folks involved, you need to cap the amount of
14 solar being built. So we're suggesting that that cap be
15 done in a lottery format. That is based on the market
16 segments that exist now according to historical data.

17 So all of the market segments that we all
18 feel are important in New Jersey are taken care of, we
19 would suggest that 20 percent extra projects get
20 accepted because there is a washout rate so that can
21 always be adjusted in the subsequent period; that
22 projects be given a six-month time to start construction
23 and have six to 12 months after that to complete
24 construction.

25 MR. DI PIRRO: And to wrap up, we wanted to

139

1 address quickly the goals of the EMP and also the
2 interests of stakeholders and how those would be
3 effected by this kind of proposals.

4 In terms of the goals of the EMP this would
5 drive down the cost of energy, promote clean in-State
6 generation, promotes meeting and, in fact, expanding the
7 RPS if the price is approaching the floor which
8 stimulates the economy for our green jobs to keep and
9 attract businesses which we know is a priority, and for
10 jobs, to keep thousands of green jobs that have been
11 created through the wise previous policies of advancing
12 solar in the State.

13 And, finally, everyone has a stake in these
14 issues and we wanted to speak just briefly to those
15 folks, ratepayer's significant concern. This kind of
16 reduction in the SACP would decrease rates which would
17 be an important achievement. Green jobs in the economy,
18 we mentioned for certainty in financing would allow our
19 business owners in the state to know that they could
20 afford to put solar on their building because they know

21 what the cost is, they know how they'd be able to sell
22 their SRECs going forward.

23 The LSEs are important in the process.
24 They're the ones who pay for SRECs. They would enjoy
25 the reduction in the SACP and they'd have benefit of the

140

1 cap that Howard described.

2 And we can't forget municipalities and
3 schools. They have bonded significant solar projects.
4 They are absolutely required to make their bond payments
5 and we need to sure up the SREC market so they will have
6 that stream of income and we don't disadvantage our
7 municipalities and schools in these tough economic
8 times.

9 And the same, of course, is true for the
10 businesses and residences. Those folks might have done
11 a solar construction project by taking a loan out, but
12 those loan payments to them are equally important. We
13 hope these things will help you get into the master plan
14 and provide a mechanism to give a strong and viable
15 market.

16 MR. FLEISCHER: And we're available to
17 discuss it with you.

18 PRESIDENT SOLOMON: Thank you very much.
19 Roman Soiko.

20 MR. SOIKO: Thank you, President Solomon.

21 PRESIDENT SOLOMON: Make sure you take your
22 time, the court reporter's got to take it down.

23 MR. SOIKO: We need to be aware of the
24 crisis facing New Jersey, in United States of America,
25 North America, and the world. The threat that is

1 hanging over the entirety of humanity has manifested
2 itself in severe weather episodes over the last decade.

3 PRESIDENT SOLOMON: I don't know if you want
4 to give her your written statement or you want to go on.
5 And if you're going to go on, it's going to be taken
6 down stenographically, you have to take your time and
7 make sure you speak up.

8 MR. SOIKO: Okay.

9 PRESIDENT SOLOMON: Take your time.

10 MR. SOIKO: Hurricanes Katrina and Wilma,
11 the flooding in Australia and Pakistan, the forest fires
12 in Russia, and only recently one of the hottest summers
13 in New Jersey for years. These are not isolated events.
14 These events directly correlate to global warming,
15 anthropogenic global warming. To deny the obvious is
16 tantamount to denying the Holocaust and in many cases
17 the comparisons can be similar.

18 Instead of Zyklon B, we have used another
19 chemical, chlorofluorocarbons that emanate from our
20 dirty energy which powers our state economy. New Jersey
21 is considered by the Environmental Protection Agency as
22 one the dirtiest states in the country and we lead the
23 way in Superfund sites with 1,091. This is
24 unacceptable.

25 Now you attempt to derail the program of

1 action which will ensure New Jersey does not renege on
2 its obligations on clean energy. Clean energy and the

3 green economy is of paramount importance for a multitude
4 of reasons. They are:

5 One. Clean energy provides an environment
6 which is protected. We've seen the disaster in Gulf of
7 Mexico and Fukushima. This cannot happen in New Jersey.

8 Two. It creates employment. The green
9 economy could be the states' new renaissance in one of
10 the worst economies in 80 years.

11 Three. It lowers the cost of business. My
12 energy in my house is generated by solar and the bills I
13 pay have reduced dramatically. Generation based on
14 solar energy is cheap, limitless, and free. Indeed,
15 solar energy is the original source of energy in the
16 universe.

17 Four. Tourism. Many tourists who want to
18 see the future will want to come to New Jersey to see
19 the future development.

20 Five. Possible source of budget balancing.
21 We all know the budget is in crisis which we know that
22 you, as Governor Chris Christie, have spent time
23 addressing. This is commendable. Perhaps if New Jersey
24 had enough clean energy, it could export it to
25 neighboring states, such as Pennsylvania, New York, and

143

1 Delaware.

2 Clean energy is needed more than ever. Why
3 in the days of then gas prices have hit \$147 per barrel
4 and now are dancing around \$100 per barrel are you
5 cutting back? As a consequence of high fuel prices,
6 inflation has soared destroying the State's economy.
7 Clean energy will be a source of lower transport costs.

8 Since transport costs are cheaper, prices will fall, and
9 inflation will be controlled.

10 New Jersey has much capacity for clean
11 energy. We have 127 miles of coastline which could
12 generate wave energy and our wind from the Atlantic is
13 also strong. We are the second leading state of solar
14 power. And considering the recent climate we have been
15 having, generating solar power will be easy.

16 Hydroelectric power is also a possibility as
17 we are a state that is surrounded by water.

18 What I do not understand is why you want to
19 set the state back to the Industrial Revolution? Peak
20 oil has come and gone which eliminates this as a cheap
21 source of energy. Coal is being extracted to its bare
22 bones and is the usual suspect in many mental illnesses
23 in children and adults. Natural gas prices have soared
24 as well. You speak of fiscal responsibility. How is
25 cutting on clean energy fiscally responsible?

□

144

1 You want to provide a better state. We all
2 do. And we at the Sierra Club believe that the
3 environment is one of New Jersey's greatest assets and
4 let it work in our favor in creating energy not for a
5 21st Century economy, not a 19th Century economy.

6 Thank you.

7 PRESIDENT SOLOMON: Thank you.

8 we have 39 people who are here to speak.
9 There's no way we're even going to come close to that
10 number.

11 what I would do is we'll run for another

12 hour, a little over an hour. And then we're going to
13 schedule another hearing for Trenton.

14 So if anybody who feels they prefer not to
15 speak today, come back at a later day. Let Greg know.
16 But we'll go for about another hour. At the rate we're
17 going, we'll probably hit 12 to 15 of these speakers.

18 Marta Loc.

19 Good evening.

20 MS. LOC: Good afternoon.

21 My name is Marta, M-a-r-t-a, and last name
22 Loc, L-o-c. And I will be speaking on behalf of
23 Princeton Power Systems. And in light of the some of
24 lengthier testimony, I am going to try to make mine very
25 brief, sweet, and direct.

145

1 So without further adieu, I will continue my
2 testimony.

3 As a result of the debt ceiling increase in
4 recent enactments to fuel economy extenders, we believe
5 it is the imperative that we re-examine and embrace
6 electric vehicles, plug-in hybrid electric vehicles, and
7 highway electrification.

8 As a way of background, fuel economic
9 standards for passenger cars have remained the same
10 since 1985. After a fuel standard examination, we have
11 taken unprecedented steps to increase fuel efficiency,
12 reduce pollution.

13 New Jersey should not stray from our
14 nation's goals, but disregarding electric and plug-in
15 hybrid vehicles is a significant addition to the Energy
16 Master Plan. In order to achieve the 54.5 miles per

17 gallon standard by 2025, the public will notice a
18 significant increase in both electric vehicles and
19 plug-in hybrid electric vehicles in the market and on
20 the road itself.

21 The high infrastructure and smart grid
22 integration supporting these vehicles is crucial for the
23 already ageing and stressed electric grid.

24 New Jersey is a leader in green technology
25 and renewable generation. We continue to focus and stay

146

1 on target for 30 percent integration of renewables.
2 Let's maintain our leadership role by equally
3 incorporating smart grid technology and establishing an
4 electrification infrastructure to support the nation's
5 goal while achieving the 54.5 miles per gallon.

6 This Energy Master Plan is the State's
7 responsibility to foster growth in clean technology and
8 manufacturing so please let's continue to do that.

9 Thank you.

10 PRESIDENT SOLOMON: We're going to take five
11 minutes.

12 (A short recess is taken.)

13 PRESIDENT SOLOMON: We're going to get
14 started again.

15 The next speaker is Paul Lipkin.

16 Paul Lipkin, are you here?

17 Ralph Orlando.

18 Mr. Orlando, come on up. Everybody else be
19 seated.

20 MR. ORLANDO: Thank you, President Solomon

August 3-2011 EMP Public Hearing.txt
21 and Commissioners. My name is Ralph Orlando,
22 O-r-l-a-n-d-o. I'm here on behalf of New Jersey NAIOP,
23 N-A-I-O-P. NAIOP is a commercial real estate
24 development association with members that represent,
25 either own or manage a 300 million square feet of space,

147

1 commercial space in the State of New Jersey.

2 I'm just going to just give you some bullet
3 points with response to the Energy Master Plan and a
4 written report from NAIOP will be presented to the
5 commission.

6 My first comment is that NAIOP very much
7 endorses the plan and many of the aspects of the plan so
8 we commend the commission for your efforts.

9 First comment is concerning the solar
10 analysis and the cost basis that was presented in the
11 plan. We believe that, as we understand it, a lot of
12 the data was based on 2008 data. We believe that it is
13 outdated at this point and that the technology and some
14 of the current cost information which I think should be
15 considered with regard to reevaluation of that and
16 possibly a different conclusion may be reached from
17 those updated information as you would receive. And we
18 would be happy to provide some of that to you.

19 PRESIDENT SOLOMON: If you have updated
20 information, I'm sure we have access to it, but anything
21 that you have that you would like us to look at and
22 perhaps relying on, could we get that?

23 MR. ORLANDO: We will get that to you, sir.
24 Thank you.

25 We also -- just a comment that I think the
Page 126

1 solar alternate -- alternative compliance payment matter
2 needs to be better defined. We believe that no new
3 capital and no new substantial capital is going to come
4 into the marketplace without SREC certainty. And I know
5 that's been discussed a lot this evening so I'll just
6 make that comment and again some data will be provided
7 to the commission.

8 Virtual net metering, we have a comment on
9 that which is currently energy may be sold only to one
10 party off a meter, a problem for multi-tenant buildings
11 for both commercial, as well as residential facilities.
12 Virtual net metering would allow multiple tenants to
13 benefit from the marketplace and we believe that should
14 be provided as well.

15 Community net metering, a comment on that.
16 Pilot projects should be done to obtain data needed to
17 determine best practices to accomplish community net
18 metering across large industrial and mixed use parks.
19 And also it would be beneficial for residential
20 development as well.

21 Pilots, we believe that very strongly
22 support the establishment of pilot programs in order to
23 develop the defined energy policies that you're
24 presenting in the plan, those have been very successful
25 in the development of other energy plans throughout the

1 country and we would like to see pilot programs
2 established and we're going to recommend some to the

August 3-2011 EMP Public Hearing.txt
3 commission.

4 with regard to existing buildings, the
5 Energy Master Plan seems to focus rather strenuously on
6 the new construction. As we see it, New Jersey new
7 construction will be very limited in the foreseeable
8 future. We would like to recommend that the Energy
9 Master Plan relook at the importance and the energy
10 efficiency that you'd be gaining from, especially on a
11 short-term basis, achieving these efficiencies on
12 existing building. We suggest that policies and
13 provisions be provided for retrofits, modernizations,
14 and upgrades. And caps should be eliminated, for
15 instance, on items such as efficiency improvements to
16 lighting, just one, and we will present some others to
17 the commission for consideration.

18 with regard to expanded SRECs, we would
19 recommend that they be allowed for data centers up to
20 69 kv and also SRECs should be allowed for
21 behind-the-meter.

22 The brownfields, we do support the
23 development of brownfields for solar using brownfield
24 sites for solar and we commend the commission for
25 suggesting that and stressing that. However, in our

150

1 experience there is some dichotomy with regulations that
2 we will present to the commission that do make it
3 difficult to provide the amount of solar we will need on
4 these brownfield sites. So we would like to encourage
5 that it does take place but will provide some
6 information that help ensure that does get accomplished
7 as planned.

8 So I thank you very much for this time this
9 afternoon.

10 PRESIDENT SOLOMON: Thank you. That was
11 very helpful, and I look forward to getting your
12 information.

13 Michael Flett.

14 I also have Frank Robinson with him.

15 Is that right?

16 MR. ROBINSON: Yes.

17 Good afternoon.

18 We want to thank you all for having us and
19 giving us the opportunity to testify in front of you
20 today. I'm Frank Robinson with Robinson Capital
21 Partners.

22 Here's my colleague, Michael Flett, Flett
23 Exchange.

24 We are appearing before you today on behalf
25 of the New Jersey Renewable Energy Coalition which is a

151

1 coalition of renewable energy private equity investors
2 and energy professionals committed to supporting policy
3 that will maintain and sustain a healthy renewable
4 energy in New Jersey.

5 As President of Robinson Capital Partners,
6 we currently have over 80 megawatts of both net metered
7 and solar farms in production throughout New Jersey,
8 with additional investments in biomass and anaerobic
9 digestion, new wind technology, and other clean tech
10 investments.

11 President Solomon we're privileged to be

August 3-2011 EMP Public Hearing.txt
12 before you today to comment on the Governor's draft
13 Energy Master plan. Along with the Governor, we're
14 concerned with maintaining a sustainable, vibrant, and
15 healthy solar energy industry in New Jersey.

16 we do have, however, serious concerns with
17 the policy direction that the Energy Master Plan is
18 recommending for solar and other renewable energy
19 sources.

20 My colleague Michael Flett is an expert on
21 the SREC market and can comment on market changes that
22 we recommend.

23 First, I'd like to talk about the Energy
24 Master Plan analysis on solar energy and stated solar
25 energy in New Jersey. I'll begin by speaking to the

152

1 economics of this industry currently and whether or not
2 New Jersey is poised to reach an ultimate RPS.
3 Calculations indicate an RPS goal of 5000 megawatts in
4 the State of New Jersey by the year 2020 -- 2026.
5 Excuse me.

6 For ease of discussion purposes today, we'll
7 round the current New Jersey marketplace to 400
8 megawatts of both residential and commercial --

9 THE COURT REPORTER: You're getting faster.
10 You were good in the beginning.

11 PRESIDENT SOLOMON: Take your time.

12 MR. ROBINSON: For ease of discussion
13 purposes today, let's round the New Jersey current
14 marketplace to 400 megawatts of both residential and
15 commercial solar projects. Over the past couple years,
16 the prices to install a project have dropped

17 considerably.

18 So based on our 400 megawatts, if we use a
19 current price per kilowatt to develop these projects at
20 \$3.50, we are talking about an industry that represents
21 a minimum of \$1.4 billion invested throughout New
22 Jersey. That money was invested in a market with stable
23 and high valued SRECs, coupled with strong federal
24 incentives. It's been a vibrant market to say the
25 least, but the industry has changed and volatile and

153

1 there's extreme skepticism about the incentives and
2 perhaps most important there's no clear direction as to
3 where these incentives end up. So if we're at a
4 minimum, \$1.4 billion industry today, we can assume
5 using the same valuation that we have a minimum of
6 \$15 billion remaining to hit that RPS as far as a
7 capital infusion into this marketplace.

8 Michael and I represent the equity and debt
9 market that are bullish on investing in this market.
10 Our concern is that the current market volatility is not
11 conducive to supporting the nearly \$15 billion worth of
12 investment to get to our RPS.

13 As for analysis in the Energy Master Plan,
14 we do appreciate the efforts of the Board, but we would
15 like to express some of the data and concerns on the
16 data that don't necessarily support the theories and the
17 impacts that have been represented.

18 The cost in economics in the Energy Master
19 Plan are not congruent with current market. Over the
20 last 15 months, costs for procurement and construction

21 have dropped nearly 40 percent. What has not dropped in
22 the New Jersey Energy -- is the New Jersey energy
23 infrastructure upgrades that are a hundred percent the
24 responsibility of the project.

25 The Energy Master Plan failed to quantify

154

1 the benefit to New Jersey's energy infrastructure
2 upgrades via solar incentives, first, essentially
3 implementing a tax that would accomplish the same.
4 Those same incentives -- statewide incentives that
5 upgrade our infrastructure, attract investment in
6 projects which have resulted in an estimated 20,000 plus
7 jobs in this industry.

8 Most of those jobs have been created during
9 the recession which has kept many New Jersey families in
10 the State. I can tell you that I sit on the Board of
11 Directors for the New Jersey Builders Association and
12 many of the people that are skilled and nonskilled
13 workers that lost jobs in that association and that
14 industry have moved to the solar industry.

15 In addition to a thriving job market and
16 significant investment into New Jersey's energy
17 infrastructure, our industry is reducing the net energy
18 imports for New Jersey. New Jersey currently imports
19 30 percent of our energy from surrounding states. Our
20 current solar production accounts for less than
21 2 percent of our total energy use in the State.

22 I mentioned that New Jersey is a net
23 importer of energy because it's relevant in terms of
24 utility scale projects and their significance to our
25 state reaching the ultimate RPS.

1 The Energy Master Plan addresses solar farms
2 by suggesting that brownfield and landfill sites be the
3 target for future development. While we support that,
4 we express our concern that environmental issues and
5 costs, such as remediation will deter these projects
6 from ever being completed. These costs will create an
7 adverse reaction to the falling price points that we
8 have seen in developing projects and certainly not
9 sustainable with the falling SREC market.

10 It's clear in the Energy Master Plan that
11 the administration is supportive of net metered projects
12 and we appreciate and share that support. In fact, we
13 would like to take the net metered projects one step
14 further than traditional behind-the-meter and propose
15 that third party providers be able to sell across in the
16 event of bankruptcy or business closure.

17 I can tell you on daily basis one of my
18 largest sticking points in negotiating net metered
19 contracts is what happens when a tenant closes its
20 operations, it can be a dramatic shift in the financials
21 of the project.

22 With New Jersey being a net importer of
23 energy, we know that the solar energy produced in this
24 state will be used and stay in this state.

25 In summary, I think -- we think the Draft

1 Energy Master Plan has room for improvement and we're
2 lending our assistance in creating policy that will

August 3-2011 EMP Public Hearing.txt
3 rejuvenate what has been a thriving industry back to
4 prosperity.

5 For more on the SREC market, here is Michael
6 Flett.

7 Thank you.

8 MR. FLETT: Good afternoon.

9 My name is Michael Flett. I run the Flett
10 Exchange which is an Internet based exchange to provide
11 a transparency and liquidity to the New Jersey SREC
12 market. Over 3,000 New Jersey solar installations used
13 my exchange to sell their SRECs. We've been operational
14 24/7 since 2007. Many of the energy companies using the
15 exchange to procure SRECs to satisfy their RPS standard.

16 The SREC market in New Jersey is responsible
17 for most of the success of the solar industry in New
18 Jersey. It sets New Jersey apart from every other state
19 and is bringing the capital needed to develop solar in
20 New Jersey. It is competitive in nature, thus over time
21 it will bring the most competitive price to the
22 ratepayer.

23 The development of solar in New Jersey has
24 just exceeded the State mandates for the first time.

25 I will speak to the current state of the

157

1 SREC market in a few moments.

2 I would like to point out two areas in the
3 Energy Master Plan related to SRECs which are incorrect.
4 In both of these, I'll cite them specifically, they
5 overestimate the cost of solar in the past and also in
6 the future. Figure 39 on page 91 of the EMP shows
7 historical number of SRECs traded and the SREC prices as

8 documented by the CEP.

9 The EMP concludes from this data that in,
10 quotes, Steady appreciation in SREC prices runs counter
11 to the substantial solar technology progress that has
12 been sustained in the U.S. and New Jersey.

13 This conclusion is false and the data is
14 misleading. The reality is exactly the opposite. SREC
15 prices in the spot market have declined from an all-time
16 high of \$694.70 on August 4th of 2009 to a settlement of
17 \$655 on February of 2011 which matches the data used in
18 the Energy Master Plan. This is a 6 percent decline in
19 the price, while Figure 39 in the EMP shows an increase
20 from five to \$600 or 28 percent increase.

21 The data should be replaced by the actual
22 spot price of SRECs, not the volume weighted average
23 price as reported by the CEP which is not correct.

24 The conclusion should read that spot SREC
25 prices in New Jersey have declined during the past two

158

1 years based on a declining SACP schedule and the volume
2 of SRECs for compliance by LSEs have grown
3 substantially.

4 Paragraph 2 on page 94 states that the total
5 annual estimated SREC costs in 2015 will be
6 \$525 million. This estimate is absolutely wrong. It's
7 way too high. Based on the state mandates for solar in
8 Energy Year 15, there are 965,000 SRECs required.
9 Backing out the EMP estimate implied SREC price is \$544.
10 The price for Energy Year 2015 SRECs in February when
11 EMP was written was \$300. The current price for Energy

12 Year 15 SRECs is about 175. Based on the reality of
13 these prices which are real and trading, they are not
14 estimates written by economists. The real cost is
15 between 168 and \$289 million, not the \$525 million which
16 is stated in the EMP. The EMP overstates costs by 180
17 to 310 percent.

18 I'm going to skip and close quicker and I
19 apologize for taking so long.

20 PRESIDENT SOLOMON: Just don't speak too
21 fast.

22 MR. FLETT: It was going a lot quicker when
23 I was driving down the Turnpike.

24 I'm going to skip a bunch of this. There's
25 a lot of stuff we already know.

159

1 One thing as from the New Jersey Renewable
2 Energy Coalition suggests the following:

3 One. We agree with the EMP that the current
4 high SACP out to 2016 should be reevaluated. Solar
5 costs have decreased significantly since the original
6 SACP was set. It is apparent that a \$600 SREC is not
7 needed to support solar development nor is that higher
8 price needed as an incentive for energy companies to
9 purchase SRECs.

10 Aside from the EMP, it's more of a
11 legislative issue, but S2371 should be supported.
12 Without the increase in the RPS, the overflow of Energy
13 Year 2012 SRECs will flood the market and shirk off
14 installations to one and a half to two and a half years.
15 The infrastructure in solar installation firms and the
16 jobs associated with them will disappear overnight if

17 this is not done.

18 Business owners who have invested in solar
19 to lower price -- invested in solar with these lower
20 SREC prices will be hurt.

21 And the third thing that the EMP does not
22 identify the full net benefits realized by solar
23 installed in New Jersey. All references to SREC
24 identified them as costs and do not identify the
25 benefits realized by the initial investment and

160

1 subsequent SREC income.

2 At Flett Exchange, we mail checks to almost
3 a thousand families, businesses, towns, and
4 municipalities each month. Not only do these
5 participants invest upfront money which create jobs in
6 New Jersey, but the income generated from SRECs most
7 likely go directly back into the State's economy, from
8 paying down their systems, and any potential gains will
9 most likely go towards operating expenses, especially in
10 towns and municipalities.

11 I appreciate the opportunity to speak on
12 behalf of the New Jersey Renewable Energy Coalition.

13 PRESIDENT SOLOMON: You said increasing --
14 you're talking about increasing the solar carve-out in
15 the RPS so then the target will then create more of a
16 demand. Is that correct?

17 MR. FLETT: S2371 we have to buy 442,000
18 SRECS this year. Instead of going to 596, it could go
19 to 772. It will soak up this extra amount that, what I
20 see, is we have a lot of incentive that came from the

21 bonus appreciation so the investment got lumpy. We got
22 a lot of people to invest in New Jersey's infrastructure
23 and what we're looking for is more legislation for some
24 proactive legislation which is 2371.

25 PRESIDENT SOLOMON: Do you have any analysis

161

1 of what would be the economic impact; that is, where our
2 SRECs are likely to go and what would be the cost to
3 ratepayers? Is that done anywhere? Do you have it
4 anywhere? We have our economist and we have some
5 analysis.

6 MR. FLETT: I get that question all the
7 time. Everybody is calling me, they're like, Mike,
8 where are my SRECs? I said they're \$200 and bid has
9 gone to 20. Well, what is going to happen?

10 If 2371 passes, maybe they'll be more than
11 350 again. You're never going to see a \$600 SREC again.

12 That is where in conjunction with the Energy
13 Master Plan rolling back the SACP I think all you have
14 to do is the math, whatever the lower SACP, compared to
15 the current one, and that is what the ratepayer will
16 potentially save if we ever go short again.

17 PRESIDENT SOLOMON: You're not suggesting
18 setting the SACP -- setting the SACP the legislature
19 needs to set a floor that would be an option. The other
20 option is simply raise the target in the solar market.

21 MR. ROBINSON: That is the short-term
22 answer.

23 PRESIDENT SOLOMON: The floor or is it the
24 carve-out?

25 MR. ROBINSON: I would say the carve-out.

1 Both are needed.

2 PRESIDENT SOLOMON: Thank you.

3 MR. FLETT: Thank you for the opportunity.

4 MR. ROBINSON: Thank you.

5 PRESIDENT SOLOMON: Scott Yappen.

6 MR. YAPPEN: Should I say good evening yet?

7 PRESIDENT SOLOMON: Oh, yeah, you can.

8 MR. YAPPEN: My name is Scott Yappen,

9 Y-a-p-p-e-n. I'm a Texan so I should be slow enough for
10 you. And I work with Veolia Energy North America.

11 Good afternoon. Veolia Energy North
12 America, as many of you know, owns and operates
13 distributed energy and a co-generation plant right here
14 in Trenton and has been a supplier of heating and
15 cooling in the many state buildings in the capital
16 district for roughly 25 years. We also produce electric
17 power in our facility which is sold at wholesale to PJM
18 interconnection. While many know what a co-generation
19 facility is, it is simultaneous power and thermal energy
20 from a single fuel input.

21 The Veolia Trenton facility takes its
22 technology one step further with the simultaneous
23 induction of three products: Power, heating, and
24 cooling from single fuel input, what we call
25 tri-generation, and our corporate name was TriGen.

1 The typical mix of stand-alone electric
2 generating stations includes a range of efficient

3 generators and less efficient generators considered to
4 be on the margin. On average this utility electric
5 supply system has not been able to rise above an energy
6 efficiency of roughly 33 percent since the 1960s, with
7 two-thirds of the energy being wasted up the stack in
8 form of wastewater, etcetera.

9 Co-generation and tri-generation systems
10 have efficiencies that approach 80 percent. By more
11 than doubling the efficiency of the traditional power
12 generators, these co-generation systems, what many now
13 refer to as combined heat and power, or CHP, effectively
14 cut greenhouse gas emissions in half. And as the
15 authors of 2011 Draft New Jersey Energy Master Plan
16 recognize CHP is among the most effective ways to
17 improve energy efficiency and reduce our greenhouse gas
18 emissions with the least long-term cost impacts.

19 Thus, we particularly apply the number of
20 things from the EMP. First, the administration's
21 commitment to develop 1500 megawatts of new distributed
22 generation and CHP resources where net economic,
23 environmental benefits can be demonstrated, as we know
24 there will be. The administration's awareness to CHP
25 development will require support from state incentives,

164

1 including loans and loan guarantees, including
2 streamlining permitting processes. The administration's
3 appreciation for the unique beneficial relationship
4 between district energy systems and CHP systems with
5 district energy systems providing the heat sync for the
6 thermal energy output of the CHP facility.

7 we would urge the administration to be open
Page 140

8 to the possibility that a greater share of the plan's
9 1500 megawatts of CHP might be sited on direct energy
10 systems and not restrict these systems to only 100
11 megawatts out of plan's 1500 megawatts.

12 And we applaud the administration's plan to
13 lead by example with an initiative to increase the
14 energy efficiency of state-owned and/or operated
15 buildings through energy conservation improvement,
16 including, in particular, combined heat and power.

17 Globally, Veolia operates over 800 district
18 energy networks like Trenton. Additionally, we operate
19 5000 megawatts of co-generation at hundreds of sites
20 worldwide which are fuelled by a variety of fossils and
21 renewable fuels, such as wood and biomass. We also
22 operate geothermal landfill gas, solar, and other energy
23 supply platforms worldwide.

24 I mention all of this to make a point that
25 we understand that energy will and should come from many

165

1 different sources in New Jersey. The Governor made it
2 clear that natural gas will be a significant source.
3 Given this, we should utilize natural gas for its
4 ability to generate electricity and thermal energy can
5 be maximized, in essence to maximize energy efficiency.

6 The CHP cuts emissions in half and is given
7 more and more attention. For example, the only example
8 I'll give today because of the time limitations is the
9 Massachusetts Green Community Act to pass upon your
10 radar. It was signed into law in 2008 which included
11 new alternative energy portfolio standard. Similar to

August 3-2011 EMP Public Hearing.txt
12 the renewable portfolio standard mandating that
13 utilities purchase a fixed percentage of their power
14 from energy efficiency technologies specifically
15 including CHP.

16 The alternative energy portfolio standard
17 provides financial incentives for CHP, via alternative
18 compliance payments paid by electric generators. It's
19 been an important driver in Massachusetts to stimulate
20 the CHP projects to date and fundamentally different
21 from what we have here in New Jersey from in the past.

22 This program also provides incentives for
23 existing electric only power plants to add useful
24 thermal load or for thermal only plants to add electric
25 generation.

166

1 So just to get to the recommendations that
2 we have, both financial and technical. As I mentioned,
3 the CHP portfolio standard, similar to the SREC program,
4 it could be a legislatively binding portfolio standard
5 for CHP to be instituted by the legislative branch in
6 New Jersey and to be administered by the executive
7 branch. As mentioned, an example of this that worked in
8 State of Massachusetts. That's the long-term financial
9 incentive. Short-term, loans and grants and more to the
10 pay for performance grant, \$450 per kw for
11 co-generation.

12 Those are drastically needed projects as we
13 develop them. End users can't make the decision to move
14 forward because of the feasibility studies and the all
15 money that it costs just to get it off the ground. So
16 that we have some assurances and they need to be

17 concrete and not something that can be taken away as
18 they have in the past.

19 We need to also investigate gas utility
20 tariffs, the cost of distributing gas for CHP
21 specifically. In the past there have been special rates
22 for gas, the use of private electric distribution wires,
23 electric utility interconnection standards, electric
24 utility standby rates, and other hurdles that may be
25 impediments to successful use of CHP.

167

1 As mentioned, we also need to streamline the
2 permit process for construction, air permits, etcetera,
3 because that's one of the longest lead item of any CHP
4 project in general to get off the ground.

5 So the next few years will be very
6 challenging to the State and the nation as we struggle
7 to meet what many see as competing missions, mainly that
8 of joining the world community and fighting global
9 warming and a critical battle to get the economy growing
10 again and most importantly to put people back to work
11 which is what CHP really does, it distributes generation
12 spotted all over New Jersey. If you can imagine people
13 operating plants, people construction plants, those are
14 really valuable to putting people to work.

15 So the Christie Administration should be
16 commended for its strong commitment to energy efficiency
17 and CHP in particular. Veolia commends the authors of
18 this 2011 draft for the forward-thinking approach to our
19 fight for energy independence. This plan once approved
20 will help New Jersey and the nation to take a step

21 forward in our efforts to economically reduce greenhouse
22 gas emissions in this country.

23 Thank you for your opportunity to address
24 you this afternoon and you will have our comments
25 distributed electronically.

168

1 PRESIDENT SOLOMON: Thank you very much.

2 Jeff Tittle.

3 Is he outside?

4 I know he's here.

5 Drew Cannon.

6 Drew Cannon.

7 There is Mr. Tittle.

8 Good evening.

9 MR. TITTLE: Sorry. I was out in the hall.

10 Jeff Tittle, Director of New Jersey Sierra
11 Club, speaking on behalf of the New Jersey Chapter of
12 the Sierra Club, and I'm the only person who is allowed
13 to do so. We have members and others, but they do not
14 speak for their chapter or the club directly.

15 I just wanted to start out and say that
16 sitting this through this process between the two
17 hearings, I've heard a lot of very interesting and
18 compelling testimony and a lot of facts that seem to be
19 at odds with major portion of the Energy Master Plan
20 that really question a lot of the basis of the plan
21 itself from a lot of different experts on how the solar
22 program works or should work, the fundamentals of
23 funding.

24 So I think that this will hopefully open up
25 staff and board members to really think about trying to

1 work more on this plan because it is a draft and I think
2 there are a lot of areas that need improvement and need
3 work. And there are some positive areas too. I happen
4 to be a believer in combined heat and power. It's an
5 important way of moving us forward. It's an excellent
6 gap situation where we actually help businesses, but we
7 also can provide power for those times when the
8 renewable energy or winter peak times to really help
9 move this forward as we wait and develop more renewable
10 energy.

11 And where I do have my concern is that we
12 have to look at this Energy Master Plan as part of our
13 future. It's almost like you have a master plan for
14 zoning and then you do your zoning later. And I think
15 what we're doing by going back to the RPS is we're
16 taking the vision of the master plan and we're going to
17 the old zoning, instead of moving the RPS forward based
18 on the master plan. I'm not saying that current
19 elements in place. There are many areas that need
20 improvement and updating.

21 But the one thing I think we have all seen
22 has been this robust outpouring of this process within
23 New Jersey in new technology. New Jersey is in the top
24 ten in green jobs. We're in the top ten in research and
25 development. We're in the top ten in venture capital.

1 So what we have in place is working and maybe fixing the
2 places that may need to be made better, but we shouldn't

August 3-2011 EMP Public Hearing.txt
3 make a fundamental change that goes in the wrong
4 direction. And I think about where we are --

5 PRESIDENT SOLOMON: I don't mean to
6 interrupt you because I know this has come up and I've
7 seen it before. What fundamental change are you exactly
8 talking about?

9 MR. TITTLE: Well, I think we should be
10 moving the RPS toward 30 percent and increasing the
11 steps in solar versus moving the Energy Master Plan back
12 towards the RPS. I think that's the fundamental change
13 that I see.

14 PRESIDENT SOLOMON: The only RPS that has
15 ever been actual is the 22.5, and it's a floor, right,
16 not a ceiling?

17 MR. TITTLE: But it also is tied to funding
18 and how companies perceive investment here in New Jersey
19 that if they believe --

20 PRESIDENT SOLOMON: I guess that's what I
21 want to ask. What investment are you talking about?
22 What companies are you talking about?

23 The solar is a piece of that and that's what
24 we're hearing mostly about and what is -- I mean maybe
25 I'm wrong, maybe you disagree, but I really do look to

171

1 the legislature and elected officials for guidelines for
2 incenting this policy and they sort of did with the
3 Solar Advancement Act. They set the total RPS at 22.5
4 and it was passed in '08 and became effective early in
5 '09, even though the Board may have acted in '06
6 initially.

7 In light of that, I mean I guess and maybe
Page 146

8 you may disagree, isn't that what we elect -- our
9 elected officials to do, set these policies and then we
10 adopt it?

11 MR. TITTLE: I think as a regulatory agency
12 whose focus is on energy we should be setting the
13 standards, just like the planning board passes the
14 master plan for the town and then the town council sets
15 the zoning to implement it.

16 So I think the legislature needs to conform
17 to the Energy Master Plan in 2008, not take the Energy
18 Master Plan back to the RPS. So I think you're right
19 that the legislature has a role and responsibility.

20 PRESIDENT SOLOMON: In the sense that you're
21 consistent, until the council adopts the ordinance the
22 plan has no impact. Until there is some policy
23 enactment, my position is the plan has no impact.
24 However, if --

25 MR. TITTLE: I don't want to argue land use

172

1 law.

2 PRESIDENT SOLOMON: It may have changed in
3 the many many decades since then.

4 However, if there is a rationale, is not the
5 22.5 percent one of the highest in the country?

6 MR. TITTLE: A lot of states are passing us.

7 PRESIDENT SOLOMON: who?

8 MR. TITTLE: Rhode Island, Maine,
9 California, Hawaii.

10 PRESIDENT SOLOMON: I know California did.

11 MR. TITTLE: All of the west Coast and most

August 3-2011 EMP Public Hearing.txt
12 of the East Coast states. Maine is 35 percent.

13 PRESIDENT SOLOMON: Two things I'd ask. By
14 the way, some of these states have a fairly high RPS
15 because they have hydro and they have other sources that
16 we simply don't have. That aside, if you have that
17 information, what are the states that passed this and
18 what are the states relying on, that level of the kind
19 of energy you think we have and we do have, let me know,
20 number one.

21 And, number two, what is the rationale and
22 basis for setting it at 30, because, as you said, this
23 is a draft. And, frankly, that's an argument that I
24 would say I'd probably address to Chairman Chivukula's
25 committee and ask staff to have the hearings, set out

173

1 the support, and do what they think is right. But if
2 it's something that ends up in our hands, there is some
3 sense that we should set the policy, we'll have that
4 discussion and debate internally. But I would love to
5 get the information and see what it's based on that New
6 Jersey should be at 30, not 22.5.

7 MR. TITTLE: I just want to say that you did
8 set the policy when you raised it from 8 percent in '98
9 to 22.5 in 2006 --

10 PRESIDENT SOLOMON: The Board --

11 MR. TITTLE: And then the legislature
12 followed afterwards so the Board did take the initiative
13 first.

14 PRESIDENT SOLOMON: I agree. I agree they
15 did that. I wasn't here then. I agree they did.

16 MR. TITTLE: I think that's part of your
Page 148

17 role that you have a more defined role to really look at
18 energy policy and where the State needs to go.

19 PRESIDENT SOLOMON: If that's your feeling,
20 support it and give us the data and tell us what the
21 data is based on because up till now we haven't gotten
22 it. We have a lot of criticism, got a lot of comments,
23 got some outrageous comments. We never got any support,
24 documentation, analysis, anything other than hyperbole
25 from, frankly, you or anybody else.

174

1 So by the way, I don't think you or any of
2 the others would say I was never willing to listen. So
3 let's cut the hyperbole and let's get the facts.

4 MR. TITTLE: There were studies that were
5 done back then and there's also reports --

6 PRESIDENT SOLOMON: Give us your outlook is
7 that 30 is the right target.

8 MR. TITTLE: It said that 30 was doable as a
9 target and, quite frankly, we may be able to go beyond
10 that.

11 PRESIDENT SOLOMON: Hey, by the way, do you
12 disagree that it's a floor not a ceiling?

13 MR. TITTLE: I agree with you as far as a
14 matter of law but not a matter of how people view it.

15 PRESIDENT SOLOMON: That's fine and I get
16 that.

17 Is it a floor or a ceiling?

18 MR. TITTLE: Well, I think it's a little bit
19 of both because a lot of people who are looking at it,
20 if we go beyond it, then they won't be able to get an

21 SREC or an OREC.

22 PRESIDENT SOLOMON: I can't help it if
23 people don't know what they are talking about. I can't
24 solve that problem. I can tell you as far as I know,
25 it's a floor.

175

1 MR. TITTLE: I think if you look at the RPS
2 if we go beyond it, but we may not get those funding
3 programs to go beyond that.

4 PRESIDENT SOLOMON: You keep referring to
5 the carve-outs which is statutorily mandated, and that's
6 a whole different ball game.

7 MR. TITTLE: Correct. But I think that's
8 what people look at.

9 PRESIDENT SOLOMON: I've heard this. I've
10 never seen a substantiation. I've seen a lot of
11 hyperbole. I saw it today. And my opinion is because I
12 haven't seen anything other than that, hyperbole is
13 outrageous and there's no place for it. It's part of
14 what's wrong with government, not what's right with
15 government.

16 But go ahead. Be happy to get that
17 information if you have it.

18 MR. TITTLE: Sure, those reports and the
19 other factors.

20 I wanted to go on to say that as you've seen
21 we are meeting our goals and, quite frankly, I think for
22 some people when we can do 40 megawatts in a month and
23 that's only one month and that's for solar, it shows we
24 can meet that kind of standard and we can actually get
25 to where we want to go.

1 PRESIDENT SOLOMON: Let me interrupt you.

2 MR. TITTLE: Sure.

3 PRESIDENT SOLOMON: By the way, that was hit
4 after the master plan was put out.

5 MR. TITTLE: I know.

6 PRESIDENT SOLOMON: After this devastating
7 number, this tragic reduction, which I would argue is
8 not a reduction, was out there, and a couple months now.

9 MR. TITTLE: Someone could also argue that
10 that's the benefit of the policies that are currently in
11 place.

12 PRESIDENT SOLOMON: You can argue whatever
13 you want.

14 MR. TITTLE: Today PSE&G announced they were
15 cutting their renewable energy program by about
16 90 percent.

17 PRESIDENT SOLOMON: Do you know why?

18 MR. TITTLE: I'm not sure.

19 PRESIDENT SOLOMON: They're here. I'm sure
20 they can tell you. Because I have a hunch, but I may
21 not be able to discuss it because it's in progress, but
22 I have a hunch I know and I got a hunch you're way off
23 base.

24 MR. TITTLE: I can only go by the headline.

25 PRESIDENT SOLOMON: well, you know what,

1 maybe that's the problem. Sometimes headlines are
2 misleading.

3 MR. TITTLE: And BlackBerries are dangerous.

4 PRESIDENT SOLOMON: And BlackBerries are
5 dangerous. Once you hit the send button, you can't get
6 it back.

7 Go ahead. I'm going to keep quiet.

8 MR. TITTLE: But the point I wanted to get
9 at is we see in New Jersey both a combination of
10 government intervention and market forces moving the
11 State forward within clean energy and the point I was
12 trying to make is that we did get the 40 megawatts in
13 one month and we did 25 back in December. And I think
14 there is demand in the State for renewable energy and a
15 lot of public support so we need to make sure that the
16 plan can capture the public support and the demand and
17 not be used as a way to stifle it.

18 I also believe that when you look at wind,
19 which I'm a very big believer in and I know the Governor
20 is, that last time I looked there were about
21 2500 megawatts of offshore wind that were coming to the
22 BPU for the OREC program or other things because the
23 OREC program is only 1100. But then when you looked at
24 BROEMRE is over 11,000 megawatts came in and I know a
25 lot of it is for the same sites and not all of that is

178

1 viable, but I think shows that what's in the plan, the
2 3000 megawatts of offshore wind, unless the federal
3 government continues to be a stumbling block, but they
4 can change it. What's in the master plan I think is
5 very doable, the 3000. I don't think 11,000, but 3000 I
6 think will be very doable in the State.

7 we have also have seen other innovations

8 happening whether it's geothermal. Another area which
9 was mentioned I happen to think that micro-hydro is
10 something that we have really not done enough with.
11 When I worked with the mayor of Los Angeles many years
12 ago, they actually closed the sewer plant and rebuilt it
13 in glass and they were running a 640 megawatt power
14 plant off of the waste methane. There's a lot of
15 potential out there.

16 And I think that's the point, we can't
17 always capture everything, but we need a plan that will
18 allow us to capture that vision that's out there and I
19 think we need to look beyond our normal ways of doing
20 things. Just fix power plants and power lines is not
21 enough. Not only is distributed generation a good thing
22 for New Jersey, but it puts jobs here, helps against
23 blackouts and we're not sending our money out of state
24 to coal plants in Pennsylvania or to the gas companies.
25 So I think that has a real positive economic benefit,

179

1 but also a way of leading the State forward economically
2 and environmentally. And so I think that the plan
3 talked about it, but I think we need to do more.

4 And in our technical comments -- our
5 technical comments will be pretty thick. So it will be
6 less of what you hear today, but a lot more of the
7 substance.

8 And the energy efficiency test is also very
9 critical.

10 PRESIDENT SOLOMON: we are looking for
11 something in that vein.

12 I read today that somebody said in the
13 master plan that we were advocating sludge as a
14 renewable and toxins as a renewable. Have you heard
15 anything about that? And if anybody was concerned about
16 that, it would be the Sierra Club.

17 MR. TITTLE: Yes, we are concerned.

18 PRESIDENT SOLOMON: You heard that?

19 MR. TITTLE: Not about the Energy Master
20 Plan. My comments were about proposal by the Camden
21 Municipal Utility Authority to develop that program.

22 PRESIDENT SOLOMON: Okay. But you're not
23 suggesting and you don't agree that anything in this
24 master plan could be inferred to promote or even suggest
25 we should allow that. Frankly --

180

1 MR. TITTLE: Waste energy is --

2 PRESIDENT SOLOMON: I didn't say waste
3 energy. I said sludge and toxins.

4 MR. TITTLE: Well, let me just finish.

5 Waste energy is allowed and some interpret
6 that to be part of this company that's trying to do this
7 project considers it waste energy. I do not and I'm
8 glad to hear you at least.

9 PRESIDENT SOLOMON: One of the things that
10 we could get is a suggestion or, you know, that that
11 ambiguity is out there and maybe we ought to be clear
12 about it. But you have heard that, but you're not
13 arguing that the master plan suggests that.

14 MR. TITTLE: No. But there is a proposal to
15 do that. And contracts -- and I know that from our long
16 history that you were one of the leaders opposing

17 incineration.

18 PRESIDENT SOLOMON: while I still have air.

19 MR. TITTLE: When I was shy.

20 PRESIDENT SOLOMON: Even back then, Jeff,
21 you were not shy.

22 MR. TITTLE: The other concern I wanted to
23 raise and I know that there's a lot of different pieces
24 that you have to look at, and I happen to be a strong
25 believer that the societal benefits charge is worth

181

1 keeping. I think it would go to a revolving loan
2 program. I know nothing has been set. That it may work
3 for some companies or some businesses. But I think when
4 I look at where we have revolving loans and I look at
5 the infrastructure trust, you'll see the more wealthier
6 suburbs taking advantage of it and the urban areas that
7 have less money not taking advantage of it.

8 And so the concern I have is that I still
9 believe that there are areas in the State where if we
10 don't do rebates, we need something else to take their
11 place. For instance, for small solar which I still
12 think is important, large scale solar I think is
13 wonderful. It can actually get the cost efficiency of
14 scale competitive with some of the fossil fuels. But I
15 think having people buy into solar by putting it on
16 their homes or on their businesses, small businesses, is
17 good for them, it's good for our economy, but it is also
18 part of that volume to our overall energy program. So
19 if we don't do rebates -- and I happen to think that
20 rebates work because they get people to spend some type

21 of money that they wouldn't spend otherwise and for
22 every dollar they get in rebates, they tend to put \$2 in
23 and that helps spur economy and you get taxes from that
24 additional revenue that's being spent. I know
25 personally that is why we bought a high energy efficient

182

1 hot water heater to get the extra money.

2 PRESIDENT SOLOMON: At the risk of putting
3 the government down, for every dollar we send out for
4 rebate, we spend about 10 processing it so just throwing
5 it out there.

6 MR. TITTLE: I understand that and I think
7 there are ways of trying to do it better and more
8 efficiently. But there's also other areas that we might
9 be able to come up with similar programs and I think
10 some of the things missing in the plan should be looking
11 at, if we're going to get rid of something, how can we
12 replace it because there is a demand for residential
13 solar and there are businesses that are doing very well
14 with it.

15 One example would be something that we've
16 worked on in about 30 states, it's called PACE, which is
17 Property Assessment for Clean Energy. We have
18 legislation that passed the senate. But those are the
19 kinds of programs we need to look at to find out how can
20 we replace something we may phase out. I happen to
21 think rebates are a good thing; but if we're going to
22 get rid of them, how can we then meet those types of
23 program areas and make sure people will be able to
24 participate.

25 I also think that we also have to, you know,
Page 156

1 be careful when we look at developing a plan that
2 supports a lot of new transmission.

3 Concerns that I have --

4 PRESIDENT SOLOMON: Where?

5 MR. TITTLE: It talks about additional
6 transmission in the plan.

7 PRESIDENT SOLOMON: Other than mentioning
8 the fact that Susquehanna/Roseland is being delayed and
9 that represents a reliability issue, point it out to
10 me --

11 MR. TITTLE: I will.

12 PRESIDENT SOLOMON: -- advocating new
13 transmission.

14 MR. TITTLE: It talks about reliability.
15 But if you look at the latest filings on Susquehanna,
16 the reliability issue is much less.

17 PRESIDENT SOLOMON: Let me tell you so you
18 can hear it from me, the reliability issue relates to
19 the need for new in-State distributed and mid-merit
20 generation. Period.

21 MR. TITTLE: And I also will agree with, not
22 so much the plan, but with statements that I'm also
23 concerned that the reason projects like
24 Roseland/Susquehanna are being promoted by certain
25 entities so that we can take power from the Ridgefield

1 generating station and run it to New York City.

2 PRESIDENT SOLOMON: That's a concern.

3 MR. TITTLE: And that's a very big concern
4 for us as well. We are very troubled when the rate base
5 of New Jersey builds a power plant and the owners of
6 that plant can make more funding by then shifting that
7 power and they get paid in two ways. They get paid for
8 selling the power for a higher price over there, but
9 then they get paid to build the power lines and they
10 make a nice profit on the -- and I think there's
11 something wrong in the system where we incentivize
12 shipping power that was paid for by our rate base or
13 built by our rate base and then replacement power of the
14 rate base is paying for it, just like I have real
15 problem with RMR and the Hudson generating station which
16 I think cost -- and I could be wrong and you can correct
17 me -- but some in the business community were concerned
18 about RGGI which costs about \$63 million. I believe the
19 RMR on the Hudson generating station is about 58 or
20 59 million.

21 PRESIDENT SOLOMON: I think you're right.
22 It may even be more.

23 MR. TITTLE: What?

24 PRESIDENT SOLOMON: It may even be more.

25 MR. TITTLE: It may even be more, but that's

185

1 what I could tell.

2 PRESIDENT SOLOMON: Commissioner Fox
3 said 65.

4 MR. TITTLE: To me, we're saying we can't
5 and that money is going out, whether you agree with or
6 not, I'm not here to argue, that money is going to do
7 efficiency and other things. This money is going -- and

8 I think that is that's wrong.

9 I also think that it's not really part of
10 the Energy Master Plan, but there is a concern about
11 cost in the State and I think that you should be
12 revisiting the stranded assets. Many of those projects
13 that are considered stranded assets are actually
14 facilities that are making a very nice profit and maybe
15 that money can be freed up for other things or just to
16 lower the rates to the public.

17 So I know that you need to go and a lot more
18 to speak, but I just want to leave you with this.

19 One of the great things about being where we
20 are in Trenton is you can see the history of New Jersey.
21 When you look out a block that way, you can see the
22 river, you go that way, you can see the canal. And, you
23 know, waterpower was the big thing in 1820 and canals
24 were the way of moving goods and energy. And then you
25 can go and look right down the road from here and the

186

1 first railroad in the country was built, the Amboy
2 Railroad and it went down to Bordentown eventually. And
3 steam power replaced water power. And then up the road
4 a few miles a guy by the name of Thomas Edison had an
5 idea for a light bulb. And a company here in Trenton
6 call Roebling made the wire -- the copper wire that
7 ended up sending the power all over the place.

8 And the point of all that is that New Jersey
9 has always been an innovative state. We've always been
10 a state that looked at science and technology and
11 captured it, not only for the benefit of mankind, but

12 also to move our economy, whether it's the radio or
13 television invented by Sarnoff or whether it was
14 investing in the transistor at Bell Labs, we've created
15 whole industries and whole economies by grasping the
16 future. We need an Energy Master Plan that shares that
17 vision that we're going to grab the future through new
18 technologies, whether it's wave, wind, solar,
19 micro-hydro, down the long list, geothermal, and that is
20 where we should be because that is how we really grow
21 our economy and protect our environment at the same time
22 by looking towards the future and grabbing that future.

23 It would be as if you said to Thomas Edison,
24 oh, a light bulb, we're not so sure about because of the
25 infrastructure and we're not sure how it's going really

187

1 be reliable and maybe we should focus more on whale oil
2 or kerosene lamps. I think that is this is that time
3 for us so New Jersey can have a green economy, grow its
4 economy in the right direction, save money for its
5 ratepayers because down the road energy efficiency and
6 renewable energy will be cheaper than building a lot of
7 new facilities or power lines that come from out of
8 state. And I think that future is in your hands and I
9 hope you grab that future and go with it just as so many
10 wonderful people in New Jersey have done it in the past.

11 PRESIDENT SOLOMON: Thank you, Mr. Tittle.

12 Ben Parvey is going to be our last speaker.

13 After that, we're gong to continue the
14 hearing until another date. I think we're required to
15 give at least three days notice. I'm sure it will be in
16 this room in the Statehouse Annex. I would think it

17 would be in this room. But we'll continue it at that
18 point and pick it back up as soon as we can get a room
19 and a time and get the notice out.

20 Mr. Parvey, thank you. Thank you for
21 waiting.

22 MR. PARVEY: Thank you, President Solomon,
23 Commissioners, thank you for having me.

24 And to the very tired court reporter there,
25 thank you for all your work today.

188

1 I just want to make a few quick points. I
2 realize you want to wrap up and as the last person
3 between you and the door, I'll make this brief and make
4 my point quickly.

5 There are four main points I want to make.
6 The first is when I last testified in front of you, we
7 discussed SREC markets. I said then that many of the
8 folks within the market, many of our competitors and
9 other people within the industry might have a problem
10 with me saying that SRECs do not have to be at the \$600
11 level and now it's sort of a novel idea that now I hear
12 other people signing up because they just want some sort
13 of price protection.

14 We had said before the EDC program is very
15 strong, the SREC based financing program. And I
16 remember Commissioner Fox saying, well, why do you think
17 it's undersubscribed, and I discussed then why I thought
18 it was undersubscribed, because people, you know,
19 probably wanted higher \$600 SREC prices.

20 I heard finally the market has come to the

21 point of realizing that a stable long-term contract
22 market is where it needs to be and it's helped a number
23 of projects get done that we worked on, including, you
24 know, from school districts in Ocean County to a
25 affordable housing facility in Brick to a private school

189

1 in North Jersey and, you know, it's been a very
2 effective program. So I want to reiterate that and say
3 that I've heard other people mention it today and launch
4 my support for the SREC based financing program, the EDC
5 financing program.

6 A 10-year SREC based financing program
7 allows projects to be financed and allows equity to see
8 what their yields are going to be and allows debt to
9 come into the transaction at that basic debt equity
10 structure which is about 30 to 40 percent of debt annual
11 equity, as well as the federal tax credit. So that's an
12 effective structure.

13 Secondly, I want to talk about, you said a
14 few times that the Board, the administration doesn't
15 necessarily set the policy, that you wait for the
16 legislature to set the policy.

17 I don't know that I fully agree with that
18 because there are a lot of things in here that mention
19 infrastructure and capital that's required for energy
20 infrastructure, everything from nuclear to small scale
21 solar. They all involve capital to be spent and
22 deployed within the State to create jobs. And so the
23 direction that's taken within this Energy Master Plan is
24 a direction of an administration and an administration
25 does set policy.

1 And so for the last year or so the
2 administration has said that they would like to see SREC
3 prices come down. And the BPU and the Office of Clean
4 Energy have provided a lot of economic analysis. I
5 remember one chart that sort of showed where that price
6 point should be without showing the price, but it showed
7 a chart which is a block lower than it is, about half of
8 what it is. We're now well below that half.

9 The reason I raise that in tying into
10 setting policy is the administration stands on this, and
11 which is what I'll conclude with too, is that the only
12 thing I see is on page 95 that mentions the impact of
13 creation of jobs. We've seen tons of capital deployed
14 in this state. We've seen tons of small businesses.
15 When I testified last time, talked about my one-year-old
16 son who is now one and a half and we now have another
17 one-year-old, this is about real people and real jobs
18 and real kids who live right down the street from you.

19 I left my firm in Pennsylvania. We have
20 continued to hire and grow and we're doing all the right
21 things. We're in EDA's waterfront technology center in
22 Camden, creating jobs in Camden which certainly has been
23 a priority of this state. And so a company that is
24 growing in this economy is based in large part on those
25 policies that were set forth in our address somewhat in

1 this document.

2 So it is driving policy and the

3 administration's job -- any administration's job, even
4 though you're a regulatory agency, you implement what
5 this administration wants to see in terms of policy.
6 The legislature then may actually implement the
7 mechanisms by which to do it and which then tie into the
8 regulations to carry that out. So it all is integrated
9 and all works together.

10 And so cumulative economic growth and job
11 creation should be heavily addressed.

12 PRESIDENT SOLOMON: Excuse me, sir.
13 Somebody is speaking, could you keep your voice down?

14 MR. MACKIEL: I'm here 12 hours and you're
15 ending the meeting at five something and you're not
16 allowing me to speak when I had a presentation.

17 PRESIDENT SOLOMON: We're not ending the
18 meeting, we're going to continue it --

19 MR. MACKIEL: Thank you.

20 PRESIDENT SOLOMON: -- we're going to
21 continue it to another day.

22 If you could talk outside.

23 MR. MACKIEL: I've waited 12 hours, sir.

24 PRESIDENT SOLOMON: Could you wait outside?
25 Continue. I'm sorry.

□

192

1 MR. PARVEY: So anyway my point on that is
2 simply that cumulative economic growth and job creation
3 should be heavily addressed in the Energy Master Plan.
4 I see it on page 95, talking about hundreds of millions
5 and billions of dollars, capital being deployed and jobs
6 being created, companies creating a burgeoning economy
7 and a growth sector, it is heavily setting policies, not

8 simply facts, figures, and percentages of nuclear gas,
9 elimination of coal, and RPS standards. So I do think
10 it drives policy.

11 So to address the SREC market, in that I
12 also want to say and the argument has regularly been
13 made about the impact on the ratepayers and the impact
14 of ratepayers was driving jobs out of New Jersey. I've
15 heard that argument from the administration regularly.

16 However, I think Michael Flett who does a
17 great job had mentioned something about the
18 overestimation of costs. I think a similar argument I
19 want to make to that is that if the SREC market is
20 weighing heavily on ratepayers, ratepayers are also
21 taxpayers in the state and citizens within school
22 districts where we are helping implement power purchase
23 agreements at 9 cent rates. So the energy spent for
24 those districts and those municipalities are coming down
25 significantly so cost to taxpayers are being reduced.

193

1 So while there may be an offset to some cost to
2 ratepayers, there's also a reduction of governmental,
3 municipal, MUA, hospital, and university energy costs by
4 bridging in private capital to finance power purchase
5 agreements and other energy efficiency upgrades.

6 The next point I want to make is the Energy
7 Master Plan is quite positive in its understanding of
8 the multiple sources of energy generation and demand
9 reduction being part of our energy future. I just think
10 we want to see that continue to be robust and we talk
11 about being a state of energy innovation and creating

12 jobs we want to integrate, which Blue Sky Power does,
13 energy infrastructure operations. We want to see solar,
14 energy efficiency, co-generation all be advanced.

15 And I really commend the Board for advancing
16 combined heat and power and co-generation and think that
17 that really is integral. And if you can finance a
18 co-generation or an energy efficiency project that
19 stands on its own without tons of subsidy, you can also
20 integrate a solar project and make it more economically
21 viable.

22 So a lot of folks in the solar industry need
23 to look at how they can collaborate with folks on demand
24 reduction, demand response, energy efficiency, and
25 co-generation so that we all work together to bring

194

1 prices down, but also to drive jobs and energy
2 innovation.

3 The last point I want to make is on a
4 separate point but ties it all together and that is to
5 discuss the global economic recession and the
6 general morass out there, locally, nationally, and
7 regionally, and that is to say again that this document
8 does impact. It does impact job growth. It does impact
9 industries, whether you're talking large scale utilities
10 or small contractors, like Ed who was sitting here and
11 talking about his Home Performance company and he was
12 definitely on a roll. And I think we want to encourage
13 everything from those small companies to the large
14 companies and that we want to guide job growth locally,
15 regionally, and nationally. And that is setting policy,
16 as is Assemblyman Chivukula and also the legislature

17 collaborating with you.

18 So thank you for this and I hope everyone
19 will have a nice evening.

20 PRESIDENT SOLOMON: Thank you.

21 Sir, how long will you be?

22 MR. MACKIEL: I have a short statement.

23 MS. PELLEGRINO: I bet I will be even
24 quicker than he will.

25 PRESIDENT SOLOMON: How quick will that be?

195

1 MS. PELLEGRINO: Like three minutes. You
2 can time me.

3 PRESIDENT SOLOMON: I'll tell you what, let
4 me get this gentleman and then we'll get you and then
5 we're done no matter what. I don't care who it is. I
6 don't care what they ask for.

7 Just don't speak to quickly so that the
8 court reporter who was counting is on being out of here
9 like 20 minutes ago.

10 MR. MACKIEL: I apologize if I made a stir,
11 but it's important to me.

12 PRESIDENT SOLOMON: It's all right. Go
13 ahead.

14 MR. MACKIEL: I'm making a statement --

15 PRESIDENT SOLOMON: Your name.

16 MR. MACKIEL: Vincent Mackiel.

17 I'm a ratepayer in New Jersey. I'm a
18 resident of South Amboy. And I'm making a statement
19 because I'm concerned having read the entire report that
20 program seems to turn its back on really as a human

21 being, living and needing air and water to breathe.

22 I know Governor Christie this past week
23 suffered an asthma attack or shortness of breath. I
24 live in New Jersey. I live with the remnants of the oil
25 and gas industry right in the community that I live in

196

1 South Amboy. Jersey Central, has their remnants of the
2 oil -- I mean the energy industry. Its in need of
3 asbestos cleanup. The Sun Oil on the Raritan Bay with
4 the beauty of Staten Island and the environment with so
5 much opportunity to create something different for the
6 State exists on the waterfront, polluted, in need of
7 cleanup.

8 I'm making this point because I believe that
9 the current movement or the course that we should accept
10 is the damage that some of these industries have caused
11 to the State. And what is actually going to be the cost
12 to do that for those particular industries. You
13 shouldn't clutch at the past if you're just going to be
14 passed by. As was said, some things in terms of other
15 states already doing it.

16 The State of New Jersey is entrepreneurial
17 in spirit should be more part of this plan I believe.
18 The oil commission that put out a report this year
19 stated that it was an industry-wide failure in what
20 happened in the Gulf of Mexico. That applies to all the
21 oil and gas industry, including New Jersey.

22 I'm asking this Board, BPU Board, who has an
23 obligation and you've cited that as part of your
24 executive report as being a major siren, I think you
25 call it, that we should consider that you consider that.

1 what is this Board going to do to ensure
2 that these pipelines that are cited in the various
3 documentation that I read on the Internet, what is New
4 Jersey, the BPU -- and I was going to attend the meeting
5 in Edison when you had the meeting concerning the
6 pipeline in the Raritan Bay.

7 My question is what is this Board for New
8 Jersey going to do to ensure that these pipelines are
9 safe? Not only in an environment that keeps them secure
10 but what about the people that live around them. So I
11 think it's very important.

12 I have a short while to go.

13 why turn the State back into the past and
14 use the same kinds of industry. We don't need any
15 smokestacks in Linden, New Jersey, I believe. We don't
16 need to go back with continual usage of properties for
17 industries that already demonstrated that these -- these
18 things are of the past. We don't need any more oil
19 spills in Newark. We don't need any more -- one point
20 I'd like to make, we don't need -- we have plenty of
21 sand in South Amboy. Anything the Governor should be
22 concerned about is diversifying the construction
23 resources that the state is using. I think that's a
24 definitive statement.

25 PRESIDENT SOLOMON: I'm just curious what is

1 it about the master plan that you want to --

2 MR. MACKIEL: The last point -- I think I

3 August 3-2011 EMP Public Hearing.txt
discussed a lot of the master plan.

4 The last point I wish to discuss is do not
5 consider what I'm saying as an albatross. I read that
6 in the statement that some people bringing up the
7 renewable energies and the clean energies are creating
8 some kind of albatross.

9 But consider this: The people and the
10 Indians that took over the island in San Francisco
11 established by doing that in 1969 that they were going
12 to have lands to live on forever. Those -- that
13 demonstration determined that they would have the Indian
14 rights to their land. I'm saying, isn't it necessary
15 for us to have less use of fossil fuels given all the
16 disasters and the things we've experienced in last year,
17 including internationally, isn't it important to develop
18 energy independence, lower costs, and increase
19 reliability because of lower demand and distributed
20 resources.

21 I appreciate being able to state this. And
22 I will mail or if you want it now a copy of the Nat.
23 Institute of Health report on bad air quality,
24 July 2011.

25 PRESIDENT SOLOMON: We have access to it.

199

1 MR. MACKIEL: And I'll probably send a cc to
2 Governor Christie.

3 And my last question: Can he be a poster
4 boy for better air quality in this State?

5 PRESIDENT SOLOMON: You have to ask the
6 Governor.

7 MR. MACKIEL: I appreciate that and I
Page 170

8 appreciate being able to make my statement. I think
9 it's important.

10 PRESIDENT SOLOMON: Thank you.

11 Can you hand that up?

12 And we'll let the young lady speak. She's
13 going to be brief.

14 MS. PELLEGRINO: You can time me because I
15 have a confession to make, I haven't read your whole
16 hundred plus or maybe is it 200 plus.

17 PRESIDENT SOLOMON: I have a hunch that
18 others who spoke didn't read it either.

19 But go ahead.

20 Your name.

21 MS. PELLEGRINO: My name is Margo
22 Pellegrino. Pellegrino like the water by Nestle. I'm
23 an ocean activist. I do a lot of paddling all over the
24 place. And last year I spent time on the West Coast and
25 it was really interesting to sit in on a town hall

200

1 meeting and to hear this whole town abandon Oregon which
2 doesn't get much sun but talking about solar. So I just
3 thought that was interesting.

4 That's my son over there. He is 9. He's in
5 4H. My daughter is over there. She's 6 and she wants
6 to be in 4H.

7 I don't know if you have had an opportunity
8 to go to the Burlington County Farm Fair or any farm
9 fair, but the kids are all working on sustainability
10 issues, reduce, recycle, reuse -- actually, no, it's
11 reduce, reuse, recycle -- last resort is recycle --

12 August 3-2011 EMP Public Hearing.txt
energy alternatives, etcetera.

13 We kind of owe it to our kids to really be
14 going in the direction of alternative energy. To go
15 from -- I don't know how you say it's not a reduction to
16 go from 30 percent to 22.5 percent for alternative
17 incentives, but I think that's a reduction, and that's
18 not where we need to be headed. And we were
19 unfortunately -- unfortunately ahead of us. We're going
20 to either be paying now or we're going to be paying
21 later when my kids are my age. It does not behoove us
22 to go backwards.

23 As Jeff Tittle mentioned, this is an
24 extremely innovative state. He forgot to mention that
25 Medford is actually the home of the railroad nail that

201

1 goes into the tie. That was back in the day when Boz
2 (phonetic) iron was how we got iron. And as you know
3 things change. There's a bunch of ghost towns in South
4 Jersey, but we have survived and we've lived and now we
5 have adjusted to the times and we must adjust again.

6 So I really think you ought to put that back
7 up to 30 percent. And as far as the other comment I
8 have that is what I would change in the master. Put it
9 back up to 30 percent. I would like it at 40 percent,
10 but I know you guys aren't going to go with that.

11 Then the other thing is increase our energy
12 demand reduction goals.

13 PRESIDENT SOLOMON: If can you give us a
14 basis, we'll take a look at it. I'm sure the
15 legislature will take a look at it also.

16 MS. PELLEGRINO: Maybe I'll do that.

17 PRESIDENT SOLOMON: Please.

18 MS. PELLEGRINO: Then increase our energy
19 demand reduction goals. That's crucial.

20 And actually I have to tell you with the
21 solar plan that you guys have had in place, it's been
22 phenomenal. We get two dollar bills a month with our
23 energy. We are energy misers to start with. But what
24 was really kind of cool is I live in Medford Lake. Our
25 log cabin has solar panels. Our next door neighbors who

202

1 have a brand new home that -- we are actually our
2 neighbors energy offsets credits. We are very much
3 miserly. They're not. And they found out how bad they
4 are with their energy usage when they thought, wow, we
5 want solar panels too. Our estimates and what we paid
6 was 20,000. We had the 50 percent rebate. So we
7 outlaid and got back 10,000.

8 So he thought that was a great idea. He
9 looked into it for his home, his estimate was 300,000
10 based on his use. So now he got into conservation big
11 time. So there you go, there's your education program
12 all at once.

13 And that is what I have to say and said I'd
14 keep it brief and I meant it. Thanks.

15 PRESIDENT SOLOMON: Thank you very much.

16 All right. We're going to continue the
17 meeting at a later date. I want to thank you all for
18 coming and waiting. Sorry we couldn't go on much
19 longer.

20 (Proceedings concluded at 5:55 p.m.)

1 CERTIFICATE

2
3 I, Lorin Thompson, a Notary Public and
4 Shorthand Reporter of the State of New Jersey, do hereby
5 certify as follows:

6 I DO FURTHER CERTIFY that the foregoing is a
7 true and accurate transcript of the testimony as taken
8 stenographically by and before me at the time, place and
9 on the date hereinbefore set forth.

10 I DO FURTHER CERTIFY that I am neither a
11 relative nor employee nor attorney nor counsel of any of
12 the parties to this action, and that I am neither a
13 relative nor employee of such attorney or counsel, and
14 that I am not financially interested in the action.
