**HAZARD SUMMARY**

* Nickel Hydroxide can affect you when breathed in.
* Nickel Hydroxide should be handled as a CARCINOGEN--WITH EXTREME CAUTION.
* Contact can irritate and burn the skin and eyes.
* Breathing Nickel Hydroxide can irritate the nose, throat and lungs causing cough, phlegm and shortness of breath.
* Nickel Hydroxide may cause a skin allergy. If allergy develops, very low future exposure can cause itching and a skin rash.
* Nickel Hydroxide may cause an asthma-like allergy. Future exposure can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness.
* Repeated exposure may cause scarring of the lungs and may affect the kidneys.

**IDENTIFICATION**

Nickel Hydroxide is an apple-green powder. It may be present in the workplace as a dust or as a liquid in an acid solution.

**REASON FOR CITATION**

* Nickel Hydroxide is on the Hazardous Substance List because it is regulated by OSHA and cited by ACGIH, DOT, NIOSH, NTP, DEP, IARC and EPA.
* This chemical is on the Special Health Hazard Substance List because it is a CARCINOGEN.
* Definitions are provided on page 5.

**HOW TO DETERMINE IF YOU ARE BEING EXPOSED**

The New Jersey Right to Know Act requires most employers to label chemicals in the workplace and requires public employers to provide their employees with information and training concerning chemical hazards and controls. The federal OSHA Hazard Communication Standard, 1910.1200, requires private employers to provide similar training and information to their employees.

* Exposure to hazardous substances should be routinely evaluated. This may include collecting personal and area air samples. You can obtain copies of sampling results from your employer. You have a legal right to this information under OSHA 1910.1020.

* If you think you are experiencing any work-related health problems, see a doctor trained to recognize occupational diseases. Take this Fact Sheet with you.

**WORKPLACE EXPOSURE LIMITS**

The following exposure limits are for Nickel compounds (measured as Nickel):

- **OSHA:** The legal airborne permissible exposure limit (PEL) is 1 mg/m$^3$ averaged over an 8-hour workshift.
- **NIOSH:** The recommended airborne exposure limit is 0.015 mg/m$^3$ averaged over a 10-hour workshift.
- **ACGIH:** The recommended airborne exposure limit is 0.2 mg/m$^3$ (as insoluble Nickel compounds) averaged over an 8-hour workshift.

* Nickel Hydroxide may be a CARCINOGEN in humans. There may be no safe level of exposure to a carcinogen, so all contact should be reduced to the lowest possible level.

**WAYS OF REDUCING EXPOSURE**

* Enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn.
* Wear protective work clothing.
* Wash thoroughly immediately after exposure to Nickel Hydroxide and at the end of the workshift.
* Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Nickel Hydroxide to potentially exposed workers.
This Fact Sheet is a summary source of information of all potential and most severe health hazards that may result from exposure. Duration of exposure, concentration of the substance and other factors will affect your susceptibility to any of the potential effects described below.

HEALTH HAZARD INFORMATION

Acute Health Effects
The following acute (short-term) health effects may occur immediately or shortly after exposure to Nickel Hydroxide:

* Contact can irritate and burn the skin and eyes.
* Breathing Nickel Hydroxide can irritate the nose, throat and lungs causing cough, phlegm and shortness of breath.

Chronic Health Effects
The following chronic (long-term) health effects can occur at some time after exposure to Nickel Hydroxide and can last for months or years:

Cancer Hazard
* Nickel Hydroxide may be a CARCINOGEN in humans since it has been shown to cause lung cancer in animals.
* Many scientists believe there is no safe level of exposure to a carcinogen. Such substances may also have the potential for causing reproductive damage in humans.

Reproductive Hazard
* According to the information presently available to the New Jersey Department of Health and Senior Services, Nickel Hydroxide has not been tested for its ability to affect reproduction.

Other Long-Term Effects
* Nickel Hydroxide may cause a skin allergy. If allergy develops, very low future exposure can cause itching and a skin rash.
* Nickel Hydroxide may cause an asthma-like allergy. Future exposure can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness.
* Repeated exposure may cause scarring of the lungs and may affect the kidneys.

MEDICAL

Medical Testing
Before beginning employment and at regular times after that, the following is recommended:

* Chest x-ray.

If symptoms develop or overexposure is suspected, the following are recommended:

* Daily urine Nickel levels for several days (persons with urine Nickel over 100 micrograms per liter need medical attention).
* Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.
* Lung function tests. These may be normal if the person is not having an attack at the time of the test.
* Kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an exam. Medical tests that look for damage already done are not a substitute for controlling exposure.

Request copies of your medical testing. You have a legal right to this information under OSHA 1910.1020.

Mixed Exposures
* Because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, it may worsen respiratory conditions caused by chemical exposure. Even if you have smoked for a long time, stopping now will reduce your risk of developing health problems.

Conditions Made Worse By Exposure
* Persons who are allergic to Nickel Hydroxide often have a history of allergy to Nickel-coated jewelry, watchbands, and sometimes with prolonged contact with keys, coins, etc.

WORKPLACE CONTROLS AND PRACTICES

Unless a less toxic chemical can be substituted for a hazardous substance, ENGINEERING CONTROLS are the most effective way of reducing exposure. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Isolating operations can also reduce exposure. Using respirators or protective equipment is less effective than the controls mentioned above, but is sometimes necessary.

In evaluating the controls present in your workplace, consider: (1) how hazardous the substance is, (2) how much of the substance is released into the workplace and (3) whether harmful skin or eye contact could occur. Special controls should be in place for highly toxic chemicals or when significant skin, eye, or breathing exposures are possible.

In addition, the following control is recommended:

* Where possible, automatically transfer Nickel Hydroxide from drums or other storage containers to process containers.

Good WORK PRACTICES can help to reduce hazardous exposures. The following work practices are recommended:

* Workers whose clothing has been contaminated by Nickel Hydroxide should change into clean clothing promptly.
* Do not take contaminated work clothes home. Family members could be exposed.
* Contaminated work clothes should be laundered by individuals who have been informed of the hazards of exposure to Nickel Hydroxide.
* Eye wash fountains should be provided in the immediate work area for emergency use.
* If there is the possibility of skin exposure, emergency shower facilities should be provided.
* On skin contact with Nickel Hydroxide, immediately wash or shower to remove the chemical. At the end of the workshift, wash any areas of the body that may have contacted Nickel Hydroxide, whether or not known skin contact has occurred.
* Do not eat, smoke, or drink where Nickel Hydroxide is handled, processed, or stored, since the chemical can be swallowed. Wash hands carefully before eating, drinking, applying cosmetics, smoking, or using the toilet.
* Use a vacuum or a wet method to reduce dust during clean-up. DO NOT DRY SWEEP.

PERSONAL PROTECTIVE EQUIPMENT

WORKPLACE CONTROLS ARE BETTER THAN PERSONAL PROTECTIVE EQUIPMENT. However, for some jobs (such as outside work, confined space entry, jobs done only once in a while, or jobs done while workplace controls are being installed), personal protective equipment may be appropriate.

OSHA 1910.132 requires employers to determine the appropriate personal protective equipment for each hazard and to train employees on how and when to use protective equipment.

The following recommendations are only guidelines and may not apply to every situation.

Clothing
* Avoid skin contact with Nickel Hydroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation.
* All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Eye Protection
* Wear impact resistant eye protection with side shields or goggles.
* Wear a face shield along with goggles when working with corrosive, highly irritating or toxic substances.

Respiratory Protection
IMPROPER USE OF RESPIRATORS IS DANGEROUS.
Such equipment should only be used if the employer has a written program that takes into account workplace conditions, requirements for worker training, respirator fit testing and medical exams, as described in OSHA 1910.134.

* Where the potential exists for exposure over 0.015 mg/m³ (as Nickel) use a NIOSH approved supplied-air respirator with a full facepiece operated in a pressure-demand or other positive-pressure mode. For increased protection use in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.
* Exposure to 10 mg/m³ (as Nickel) is immediately dangerous to life and health. If the possibility of exposure above 10 mg/m³ (as Nickel) exists, use a NIOSH approved self-contained breathing apparatus with a full facepiece operated in a pressure-demand or other positive-pressure mode.

QUESTIONS AND ANSWERS

Q: If I have acute health effects, will I later get chronic health effects?
A: Not always. Most chronic (long-term) effects result from repeated exposures to a chemical.

Q: Can I get long-term effects without ever having short-term effects?
A: Yes, because long-term effects can occur from repeated exposures to a chemical at levels not high enough to make you immediately sick.

Q: What are my chances of getting sick when I have been exposed to chemicals?
A: The likelihood of becoming sick from chemicals is increased as the amount of exposure increases. This is determined by the length of time and the amount of material to which someone is exposed.

Q: When are higher exposures more likely?
A: Conditions which increase risk of exposure include dust releasing operations (grinding, mixing, blasting, dumping, etc.), other physical and mechanical processes (heating, pouring, spraying, spills and evaporation from large surface areas such as open containers), and "confined space" exposures (working inside vats, reactors, boilers, small rooms, etc.).

Q: Is the risk of getting sick higher for workers than for community residents?
A: Yes. Exposures in the community, except possibly in cases of fires or spills, are usually much lower than those found in the workplace. However, people in the community may be exposed to contaminated water as well as to chemicals in the air over long periods. This may be a problem for children or people who are already ill.

Q: Don't all chemicals cause cancer?
A: No. Most chemicals tested by scientists are not cancer-causing.
Q: Should I be concerned if a chemical causes cancer in animals?
A: Yes. Most scientists agree that a chemical that causes cancer in animals should be treated as a suspected human carcinogen unless proven otherwise.

Q: But don't they test animals using much higher levels of a chemical than people usually are exposed to?
A: Yes. That's so effects can be seen more clearly using fewer animals. But high doses alone don't cause cancer unless it's a cancer agent. In fact, a chemical that causes cancer in animals at high doses could cause cancer in humans exposed to low doses.

The following information is available from:

New Jersey Department of Health and Senior Services
Occupational Health Service
PO Box 360
Trenton, NJ 08625-0360
(609) 984-1863
(609) 984-7407 (fax)

Web address: http://www.state.nj.us/health/eoh/odisweb/

**Industrial Hygiene Information**
Industrial hygienists are available to answer your questions regarding the control of chemical exposures using exhaust ventilation, special work practices, good housekeeping, good hygiene practices, and personal protective equipment including respirators. In addition, they can help to interpret the results of industrial hygiene survey data.

**Medical Evaluation**
If you think you are becoming sick because of exposure to chemicals at your workplace, you may call personnel at the Department of Health and Senior Services, Occupational Health Service, who can help you find the information you need.

**Public Presentations**
Presentations and educational programs on occupational health or the Right to Know Act can be organized for labor unions, trade associations and other groups.

**Right to Know Information Resources**
The Right to Know Infoline (609) 984-2202 can answer questions about the identity and potential health effects of chemicals, list of educational materials in occupational health, references used to prepare the Fact Sheets, preparation of the Right to Know Survey, education and training programs, labeling requirements, and general information regarding the Right to Know Act. Violations of the law should be reported to (609) 984-2202.
DEFINITIONS

ACGIH is the American Conference of Governmental Industrial Hygienists. It recommends upper limits (called TLVs) for exposure to workplace chemicals.

A carcinogen is a substance that causes cancer.

The CAS number is assigned by the Chemical Abstracts Service to identify a specific chemical.

A combustible substance is a solid, liquid or gas that will burn.

A corrosive substance is a gas, liquid or solid that causes irreversible damage to human tissue or containers.

DEP is the New Jersey Department of Environmental Protection.

DOT is the Department of Transportation, the federal agency that regulates the transportation of chemicals.

EPA is the Environmental Protection Agency, the federal agency responsible for regulating environmental hazards.

A fetus is an unborn human or animal.

A flammable substance is a solid, liquid, vapor or gas that will ignite easily and burn rapidly.

The flash point is the temperature at which a liquid or solid gives off vapor that can form a flammable mixture with air.

HHAG is the Human Health Assessment Group of the federal EPA.

IARC is the International Agency for Research on Cancer, a scientific group that classifies chemicals according to their cancer-causing potential.

A miscible substance is a liquid or gas that will evenly dissolve in another.

mg/m³ means milligrams of a chemical in a cubic meter of air. It is a measure of concentration (weight/volume).

A mutagen is a substance that causes mutations. A mutation is a change in the genetic material in a body cell. Mutations can lead to birth defects, miscarriages, or cancer.

NAERG is the North American Emergency Response Guidebook. It was jointly developed by Transport Canada, the United States Department of Transportation and the Secretariat of Communications and Transportation of Mexico. It is a guide for first responders to quickly identify the specific or generic hazards of material involved in a transportation incident, and to protect themselves and the general public during the initial response phase of the incident.

NCI is the National Cancer Institute, a federal agency that determines the cancer-causing potential of chemicals.

NFPA is the National Fire Protection Association. It classifies substances according to their fire and explosion hazard.

NIOSH is the National Institute for Occupational Safety and Health. It tests equipment, evaluates and approves respirators, conducts studies of workplace hazards, and proposes standards to OSHA.

NTP is the National Toxicology Program which tests chemicals and reviews evidence for cancer.

OSHA is the Occupational Safety and Health Administration, which adopts and enforces health and safety standards.

PEL is the Permissible Exposure Limit which is enforceable by the Occupational Safety and Health Administration.

PIH is a DOT designation for chemicals which are Poison Inhalation Hazards.

ppm means parts of a substance per million parts of air. It is a measure of concentration by volume in air.

A reactive substance is a solid, liquid or gas that releases energy under certain conditions.

A teratogen is a substance that causes birth defects by damaging the fetus.

TLV is the Threshold Limit Value, the workplace exposure limit recommended by ACGIH.

The vapor pressure is a measure of how readily a liquid or a solid mixes with air at its surface. A higher vapor pressure indicates a higher concentration of the substance in air and therefore increases the likelihood of breathing it in.
Common Name: **NICKEL HYDROXIDE**
DOT Number: **NA 9140**
NAERG Code: **154**
CAS Number: **12054-48-7**

**CARCINOGEN**
POISONOUS GASES ARE PRODUCED IN FIRE
CONTAINERS MAY EXPLODE IN FIRE

*Extinguish fire using an agent suitable for type of surrounding fire. Nickel Hydroxide itself does not burn.*
*POISONOUS GASES ARE PRODUCED IN FIRE, including Nickel Oxide fumes.*
*CONTAINERS MAY EXPLODE IN FIRE.*
*Use water spray to keep fire-exposed containers cool.*
*If employees are expected to fight fires, they must be trained and equipped as stated in OSHA 1910.156.*

**FIRE HAZARDS**

**SPILLS AND EMERGENCIES**

If Nickel Hydroxide is spilled, take the following steps:

*Evacuate persons not wearing protective equipment from area of spill until clean-up is complete.*
*Collect powdered material in the most convenient and safe manner and deposit in sealed containers.*
*Ventilate and wash area after clean-up is complete.*
*It may be necessary to contain and dispose of Nickel Hydroxide as a HAZARDOUS WASTE. Contact your state Department of Environmental Protection (DEP) or your regional office of the federal Environmental Protection Agency (EPA) for specific recommendations.*
*If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.*

**HANDLING AND STORAGE**

*Prior to working with Nickel Hydroxide you should be trained on its proper handling and storage.*
*Nickel Hydroxide is not compatible with OXIDIZING AGENTS (such as PERCHLORATES, PEROXIDES, PERMANGANATES, CHLORATES, NITRATES, CHLORINE, BROMINE and FLUORINE) and STRONG ACIDS (such as HYDROCHLORIC, SULFURIC and NITRIC).*
*Store in tightly closed containers in a cool, well-ventilated area.*

**FIRST AID**

*For POISON INFORMATION call 1-800-222-1222*

**Eye Contact**
*Immediately flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids.*

**Skin Contact**
*Remove contaminated clothing. Wash contaminated skin with soap and water.*

**Breathing**
*Remove the person from exposure.*
*Begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped.*
*Transfer promptly to a medical facility.*

**PHYSICAL DATA**

**Water Solubility:** Insoluble

**OTHER COMMONLY USED NAMES**

**Chemical Name:** Nickel Hydroxide
**Other Names:** Nickelous Hydroxide; Nickel Dihydroxide

*Not intended to be copied and sold for commercial purposes.*
