Common Name: **SODIUM ARSENATE**

CAS Number: 7631-89-2  
DOT Number: UN 1685

---

**HAZARD SUMMARY**

* Sodium Arsenate can affect you when breathed in and by passing through your skin.
* Sodium Arsenate is a CARCINOGEN--HANDLE WITH EXTREME CAUTION.
* Skin contact can cause irritation, burning, itching, skin thickening and color changes.
* Eye contact can cause irritation, burns and red, watery eyes.
* Breathing Sodium Arsenate can irritate the nose and throat. Long term exposure can cause an ulcer or hole to develop in the bone dividing the inner nose.
* High exposure can cause poor appetite, nausea, vomiting, stomach cramps, diarrhea and even death.
* High or repeated exposure may damage the nerves causing weakness, "pins and needles," and poor coordination in arms and legs.
* Sodium Arsenate may damage the liver and kidneys and may affect the heart.

**IDENTIFICATION**

Sodium Arsenate is a clear, colorless crystalline (sugar or sand-like) material. It is used in dyeing and printing, in making other arsenates, and as a germicide.

**REASON FOR CITATION**

* Sodium Arsenate is on the Hazardous Substance List because it is regulated by OSHA and cited by ACGIH, DOT, NIOSH, NTP, DEP, IARC, HHAG and EPA.
* This chemical is on the Special Health Hazard Substance List because it is a CARCINOGEN.
* Definitions are provided on page 5.

**HOW TO DETERMINE IF YOU ARE BEING EXPOSED**

The New Jersey Right to Know Act requires most employers to label chemicals in the workplace and requires public employers to provide their employees with information and training concerning chemical hazards and controls. The federal OSHA Hazard Communication Standard, 1910.1200, requires private employers to provide similar training and information to their employees.

**WORKPLACE EXPOSURE LIMITS**

The following exposure limits are for inorganic Arsenic compounds (measured as Arsenic):

**OSHA:** The legal airborne permissible exposure limit (PEL) is 0.01 mg/m³ averaged over an 8-hour workshift.

**NIOSH:** The recommended airborne exposure limit is 0.002 mg/m³, which should not be exceeded at any time.

**ACGIH:** The recommended airborne exposure limit is 0.01 mg/m³ averaged over an 8-hour workshift.

* Sodium Arsenate is a CARCINOGEN in humans. There may be no safe level of exposure to a carcinogen, so all contact should be reduced to the lowest possible level.
* The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are less than the limits listed above.

**WAYS OF REDUCING EXPOSURE**

* Enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn.  
* A regulated, marked area should be established where Sodium Arsenate is handled, used, or stored as required by the OSHA Standard: 29 CFR 1910.1018.  
* Wear protective work clothing.  
* Wash thoroughly immediately after exposure to Sodium Arsenate and at the end of the workshift.  
* Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Sodium Arsenate to potentially exposed workers.
This Fact Sheet is a summary source of information of all potential and most severe health hazards that may result from exposure. Duration of exposure, concentration of the substance and other factors will affect your susceptibility to any of the potential effects described below.

HEALTH HAZARD INFORMATION

Acute Health Effects
The following acute (short-term) health effects may occur immediately or shortly after exposure to Sodium Arsenate:

* Skin contact can cause irritation, burning and itching.
* Eye contact can cause irritation, burns and red, watery eyes.
* Breathing Sodium Arsenate can irritate the nose and throat.
* High exposure can cause poor appetite, nausea, vomiting, stomach cramps, diarrhea and even death.

Chronic Health Effects
The following chronic (long-term) health effects can occur at some time after exposure to Sodium Arsenate and can last for months or years:

Cancer Hazard
* Sodium Arsenate is a CARCINOGEN in humans. It has been shown to cause lung cancer.
* Many scientists believe there is no safe level of exposure to a carcinogen.

Reproductive Hazard
* Sodium Arsenate is teratogenic in animals at doses which are severely toxic to the mother.

Other Long-Term Effects
* Repeated skin contact can cause thickening and color changes (patchy areas of darkening and loss of pigment). Some persons develop white lines on the nails.
* Long term exposure can cause an ulcer or hole to develop in the bone dividing the inner nose.
* High or repeated exposure may damage the nerves causing weakness, “pins and needles,” and poor coordination in arms and legs.
* Sodium Arsenate may damage the liver and kidneys and may affect the heart.

MEDICAL

Medical Testing
Before beginning employment and at regular times after that, the following are recommended:

* Exam of the nervous system.
* Liver and kidney function tests.

After suspected overexposure, repeat these tests and consider an EKG. Also examine your skin periodically for abnormal growths. Skin cancer from Arsenic is easily cured when detected early.

Any evaluation should include a careful history of past and present symptoms with an exam. Medical tests that look for damage already done are not a substitute for controlling exposure.

Request copies of your medical testing. You have a legal right to this information under OSHA 1910.1020.

Mixed Exposures
* Because more than light alcohol consumption can cause liver damage, drinking alcohol can increase the liver damage caused by Sodium Arsenate.

Conditions Made Worse by Exposure
* Many scientists believe that skin changes such as thickening and pigment changes make those skin areas more likely to develop skin cancer.

WORKPLACE CONTROLS AND PRACTICES

Unless a less toxic chemical can be substituted for a hazardous substance, ENGINEERING CONTROLS are the most effective way of reducing exposure. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Isolating operations can also reduce exposure. Using respirators or protective equipment is less effective than the controls mentioned above, but is sometimes necessary.

In evaluating the controls present in your workplace, consider: (1) how hazardous the substance is, (2) how much of the substance is released into the workplace and (3) whether harmful skin or eye contact could occur. Special controls should be in place for highly toxic chemicals or when significant skin, eye, or breathing exposures are possible.

In addition, the following controls are recommended:

* Where possible, automatically transfer Sodium Arsenate from drums or other storage containers to process containers.
* Specific engineering controls are required for this chemical by OSHA. Refer to the OSHA Standard: Inorganic Arsenic, 29 CFR 1910.1018.

Good WORK PRACTICES can help to reduce hazardous exposures. The following work practices are recommended:

* Workers whose clothing has been contaminated by Sodium Arsenate should change into clean clothing promptly.
* Do not take contaminated work clothes home. Family members could be exposed.
* Contaminated work clothes should be laundered by individuals who have been informed of the hazards of exposure to Sodium Arsenate.
* Eye wash fountains should be provided in the immediate work area for emergency use.
* If there is the possibility of skin exposure, emergency shower facilities should be provided.
* On skin contact with Sodium Arsenate, immediately wash or shower to remove the chemical. At the end of the workshift, wash any areas of the body that may have contacted Sodium Arsenate, whether or not known skin contact has occurred.
* Do not eat, smoke, or drink where Sodium Arsenate is handled, processed, or stored, since the chemical can be swallowed. Wash hands carefully before eating, drinking, smoking, or using the toilet.
* Use a vacuum or a wet method to reduce dust during clean-up. DO NOT DRY SWEEP.
* When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum.

PERSONAL PROTECTIVE EQUIPMENT

WORKPLACE CONTROLS ARE BETTER THAN PERSONAL PROTECTIVE EQUIPMENT. However, for some jobs (such as outside work, confined space entry, jobs done only once in a while, or jobs done while workplace controls are being installed), personal protective equipment may be appropriate.

OSHA 1910.132 requires employers to determine the appropriate personal protective equipment for each hazard and to train employees on how and when to use protective equipment.

The following recommendations are only guidelines and may not apply to every situation.

**Clothing**  
* Avoid skin contact with Sodium Arsenate. Wear protective gloves and clothing. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation.
* All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

**Eye Protection**  
* Eye protection is included in the recommended respiratory protection.

**Respiratory Protection**  
**IMPROPER USE OF RESPIRATORS IS DANGEROUS.** Such equipment should only be used if the employer has a written program that takes into account workplace conditions, requirements for worker training, respirator fit testing and medical exams, as described in OSHA 1910.134.

* At any exposure level, use a MSHA/NIOSH approved supplied-air respirator with a full facepiece operated in a pressure-demand or other positive-pressure mode. For increased protection use in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.

**QUESTIONS AND ANSWERS**

Q: If I have acute health effects, will I later get chronic health effects?  
A: Not always. Most chronic (long-term) effects result from repeated exposures to a chemical.

Q: Can I get long-term effects without ever having short-term effects?  
A: Yes, because long-term effects can occur from repeated exposures to a chemical at levels not high enough to make you immediately sick.

Q: What are my chances of getting sick when I have been exposed to chemicals?  
A: The likelihood of becoming sick from chemicals is increased as the amount of exposure increases. This is determined by the length of time and the amount of material to which someone is exposed.

Q: When are higher exposures more likely?  
A: Conditions which increase risk of exposure include dust releasing operations (grinding, mixing, blasting, dumping, etc.), other physical and mechanical processes (heating, pouring, spraying, spills and evaporation from large surface areas such as open containers), and "confined space" exposures (working inside vats, reactors, boilers, small rooms, etc.).

Q: Is the risk of getting sick higher for workers than for community residents?  
A: Yes. Exposures in the community, except possibly in cases of fires or spills, are usually much lower than those found in the workplace. However, people in the community may be exposed to contaminated water as well as to chemicals in the air over long periods. This may be a problem for children or people who are already ill.

Q: Don't all chemicals cause cancer?  
A: No. Most chemicals tested by scientists are not cancer-causing.

Q: Should I be concerned if a chemical causes cancer in animals?  
A: Yes. Most scientists agree that a chemical that causes cancer in animals should be treated as a suspected human carcinogen unless proven otherwise.
Q: But don't they test animals using much higher levels of a chemical than people usually are exposed to?
A: Yes. That's so effects can be seen more clearly using fewer animals. But high doses alone don't cause cancer unless it's a cancer agent. In fact, a chemical that causes cancer in animals at high doses could cause cancer in humans exposed to low doses.

Q: Should I be concerned if a chemical is a teratogen in animals?
A: Yes. Although some chemicals may affect humans differently than they affect animals, damage to animals suggests that similar damage can occur in humans.

The following information is available from:

New Jersey Department of Health and Senior Services
Occupational Health Service
PO Box 360
Trenton, NJ 08625-0360
(609) 984-1863
(609) 292-5677 (fax)

Web address: http://www.state.nj.us/health/eho/odisweb/

Industrial Hygiene Information
Industrial hygienists are available to answer your questions regarding the control of chemical exposures using exhaust ventilation, special work practices, good housekeeping, good hygiene practices, and personal protective equipment including respirators. In addition, they can help to interpret the results of industrial hygiene survey data.

Medical Evaluation
If you think you are becoming sick because of exposure to chemicals at your workplace, you may call personnel at the Department of Health and Senior Services, Occupational Health Service, who can help you find the information you need.

Public Presentations
Presentations and educational programs on occupational health or the Right to Know Act can be organized for labor unions, trade associations and other groups.

Right to Know Information Resources
The Right to Know Infoline (609) 984-2202 can answer questions about the identity and potential health effects of chemicals, list of educational materials in occupational health, references used to prepare the Fact Sheets, preparation of the Right to Know survey, education and training programs, labeling requirements, and general information regarding the Right to Know Act. Violations of the law should be reported to (609) 984-2202.
DEFINITIONS

ACGIH is the American Conference of Governmental Industrial Hygienists. It recommends upper limits (called TLVs) for exposure to workplace chemicals.

A carcinogen is a substance that causes cancer.

The CAS number is assigned by the Chemical Abstracts Service to identify a specific chemical.

A combustible substance is a solid, liquid or gas that will burn.

A corrosive substance is a gas, liquid or solid that causes irreversible damage to human tissue or containers.

DEP is the New Jersey Department of Environmental Protection.

DOT is the Department of Transportation, the federal agency that regulates the transportation of chemicals.

EPA is the Environmental Protection Agency, the federal agency responsible for regulating environmental hazards.

A fetus is an unborn human or animal.

A flammable substance is a solid, liquid, vapor or gas that will ignite easily and burn rapidly.

The flash point is the temperature at which a liquid or solid gives off vapor that can form a flammable mixture with air.

HHAG is the Human Health Assessment Group of the federal EPA.

IARC is the International Agency for Research on Cancer, a scientific group that classifies chemicals according to their cancer-causing potential.

A miscible substance is a liquid or gas that will evenly dissolve in another.

mg/m³ means milligrams of a chemical in a cubic meter of air. It is a measure of concentration (weight/volume).

MSHA is the Mine Safety and Health Administration, the federal agency that regulates mining. It also evaluates and approves respirators.

A mutagen is a substance that causes mutations. A mutation is a change in the genetic material in a body cell. Mutations can lead to birth defects, miscarriages, or cancer.

NAERG is the North American Emergency Response Guidebook. It was jointly developed by Transport Canada, the United States Department of Transportation and the Secretariat of Communications and Transportation of Mexico. It is a guide for first responders to quickly identify the specific or generic hazards of material involved in a transportation incident, and to protect themselves and the general public during the initial response phase of the incident.

NCI is the National Cancer Institute, a federal agency that determines the cancer-causing potential of chemicals.

NFPA is the National Fire Protection Association. It classifies substances according to their fire and explosion hazard.

NIOSH is the National Institute for Occupational Safety and Health. It tests equipment, evaluates and approves respirators, conducts studies of workplace hazards, and proposes standards to OSHA.

NTP is the National Toxicology Program which tests chemicals and reviews evidence for cancer.

OSHA is the Occupational Safety and Health Administration, which adopts and enforces health and safety standards.

PEOSH is the Public Employees Occupational Safety and Health Act, a state law which sets PELs for New Jersey public employees.

ppm means parts of a substance per million parts of air. It is a measure of concentration by volume in air.

A reactive substance is a solid, liquid or gas that releases energy under certain conditions.

A teratogen is a substance that causes birth defects by damaging the fetus.

TLV is the Threshold Limit Value, the workplace exposure limit recommended by ACGIH.

The vapor pressure is a measure of how readily a liquid or a solid mixes with air at its surface. A higher vapor pressure indicates a higher concentration of the substance in air and therefore increases the likelihood of breathing it in.
Common Name: SODIUM ARSENATE
DOT Number: UN 1685

Carcinogen
Poisonous gases are produced in fire.
Containers may explode in fire.

Hazard Rating Key: 0=minimal; 1=slight; 2=moderate; 3=serious; 4=severe

FIRE HAZARDS
* Extinguish fire using an agent suitable for type of surrounding fire. Sodium Arsenate itself does not burn.
* Use dry chemical, CO₂, water spray, or foam extinguishers.
* Poisonous gases are produced in fire, including Arsenic fumes.
* Containers may explode in fire.
* Use water spray to keep fire-exposed containers cool.
* If employees are expected to fight fires, they must be trained and equipped as stated in OSHA 1910.156.

SPILLS AND EMERGENCIES
If Sodium Arsenate is spilled, take the following steps:
* Evacuate persons not wearing protective equipment from area of spill until clean-up is complete.
* Collect powdered material in the most convenient and safe manner and deposit in sealed containers.
* Ventilate and wash area after clean-up is complete.
* It may be necessary to contain and dispose of Sodium Arsenate as a Hazardous Waste. Contact your Department of Environmental Protection (DEP) or your regional office of the federal Environmental Protection Agency (EPA) for specific recommendations.
* If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

HANDLING AND STORAGE
* Prior to working with Sodium Arsenate you should be trained on its proper handling and storage.
* A regulated, marked area should be established where Sodium Arsenate is handled, used, or stored as required by the OSHA Standard: 29 CFR 1910.1018.
* Sodium Arsenate is not compatible with Bromine Azide; oxidizing agents (such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine and fluorine); strong acids (such as hydrochloric, sulfuric and nitric); iron; aluminum; and zinc.
* Store in tightly closed containers in a cool, well-ventilated area.

FIRST AID
In NJ, for Poison Information call 1-800-764-7661

Eye Contact
* Immediately flush with large amounts of water for at least 15 minutes, occasionally lifting upper and lower lids.

Skin Contact
* Quickly remove contaminated clothing. Immediately wash contaminated skin with large amounts of water.

Breathing
* Remove the person from exposure.
* Begin rescue breathing (using universal precautions) if breathing has stopped and CPR if heart action has stopped.
* Transfer promptly to a medical facility.

PHYSICAL DATA
Water Solubility: Soluble

OTHER COMMONLY USED NAMES

Chemical Name:
Arsenic Acid, Sodium Salt

Other Names:
Sodium Metaarsenate; Sodium Orthoarsenate; Fatsco Ant Poison; Sweeney’s Ant-Go

Not intended to be copied and sold for commercial purposes.
